168 pin unbuffered DIMM Modules

- 168 Pin JEDEC Standard, Unbuffered 8 Byte Dual-In-Line SDRAM Module for PC main memory applications
- 2 bank 4M x 64, 4M x 72 organisation
- Optimized for byte-write non-parity or ECC applications
- Fully PC66 layout compatible
- JEDEC standard Synchronous DRAMs (SDRAM)
- Performance:

		-10
f _{CK}	Max. Clock frequency	66 MHz @ CL=2 100 MHz @ CL=3
t _{AC}	Max. access time from clock	9 ns @ CL=2 8 ns @ CL=3

- Single +3.3V(± 0.3V) power supply
- Programmable $\overline{\text{CAS}}$ Latency, Burst Length and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- Decoupling capacitors mounted on substrate
- All inputs, outputs are LVTTTL compatible
- Serial Presence Detect with E²PROM
- Utilizes 16 / 18 2M x 8 SDRAMs in TSOPII-44 packages
- 4096 refresh cycles every 64 ms
- Gold contact pad
- Card Size: 133,35 mm x 29.21 mm x 4,00 mm for HYS64(72)V4120GU

The HYS64(72)V4120GU-10 are industry standard 168-pin 8-byte Dual in-line Memory Modules (DIMMs) which are organised as 4M x 64 and 4M x 72 in two banks high speed memory arrays designed with Synchronous DRAMs (SDRAMs) for non-parity and ECC applications. The DIMMs use 16 2M x 8 SDRAMs for the 4M x 64 organisation and additional two SDRAMs for the 4M x 72 organisation. Decoupling capacitors are mounted on the PC board.

The DIMMs have a serial presence detect, implemented with a serial E²PROM using the two pin I²C protocol. The first 128 bytes are utilized by the DIMM manufacturer and the second 128 bytes are available to the end user.

All SIEMENS 168-pin DIMMs provide a high performance, flexible 8-byte interface in a 133,35 mm long footprint. This SDRAM module is available with a board-height of 1,15"

Notes:

1. The specified values are valid when addresses are changed no more than once during $t_{CK}(\text{min.})$ and when No Operation commands are registered on every rising clock edge during $t_{RC}(\text{min.})$. Values are shown per module bank.
2. The specified values are valid when data inputs (DQs) are stable during $t_{RC}(\text{min.})$.
3. An initial pause of $100\mu\text{s}$ is required after power-up, then a Precharge All Banks command must be given followed by 8 Auto Refresh (CBR) cycles before the Mode Register Set Operation can begin.
4. AC timing tests have $V_{il} = 0.4\text{ V}$ and $V_{ih} = 2.4\text{ V}$ with the timing referenced to the 1.4 V crossover point. The transition time is measured between V_{ih} and V_{il} . All AC measurements assume $t_T = 1\text{ ns}$ with the AC output load circuit shown.

fig.1

5. If clock rising time is longer than 1 ns , a time $(t_T/2 - 0.5)\text{ ns}$ has to be added to this parameter.
6. If t_T is longer than 1 ns , a time $(t_T - 1)\text{ ns}$ has to be added to this parameter.
7. Any time that the refresh Period has been exceeded, a minimum of two Auto (CBR) Refresh commands must be given to "wake-up" the device.
8. Self Refresh Exit is a synchronous operation and begins on the 2nd positive clock edge after CKE returns high. Self Refresh Exit is not complete until a time period equal to t_{RC} is satisfied once the Self Refresh Exit command is registered.
9. Referenced to the time which the output achieves the open circuit condition, not to output voltage levels.
10. t_{DAL} is equivalent to $t_{DPL} + t_{RP}$.

A serial presence detect storage device - E²PROM - is assembled onto the module. Information about the module configuration, speed, etc. is written into the E²PROM device during module production using a serial presence detect protocol (I²C synchronous 2-wire bus)
