

# SHM-12 Ultra-Fast, 12-Bit Linear Monolithic Sample-Hold Amplifiers

# FEATURES

- Fast acquisition time:
  - 10ns to ±0.1% 15ns to ±0.024% 20ns to ±0.012%
- ±0.006% Nonlinearity
- 65µVrms output noise
- 120MHz small signal bandwidth
- 55MHz full power bandwidth
- –80dB feedthrough
- 1ps Aperture jitter
- 250mW power dissipation
- Low cost

# **GENERAL DESCRIPTION**

The SHM-12 is an extremely high-speed and accurate monolithic sample-and-hold amplifier designed for fast data acquisition applications. The SHM-12 is accurate ( $\pm$ 1LSB at 12 bits over the full military temperature range) and is very fast (10ns and 15ns acquisition times to accuracies of 10 and 12-bits, respectively). With this high performance and a full power bandwidth of 55MHz, the SHM-12 is an ideal device for driving flash and high-resolution subranging A/D converters.

A careful design optimizes the device for accuracy and speed over the full military temperature range. The droop rate is a low  $\pm 0.5 \text{mV/}\mu\text{s}$ . The 30mA output current and guaranteed specifications for a 100 $\Omega$  load provide high drive capability. Operating from  $\pm 5\text{V}$  supplies, the SHM-12 consumes only 250mW of power.

### INPUT/OUTPUT CONNECTIONS (CLCC and SOIC-20 Packages)

PIN	FUNCTION	PIN	FUNCTION
1	-5V SUPPLY	20	+5V SUPPLY
2	-5V SUPPLY	19	SAMPLE/HOLD
3	NOT CONNECTED	18	SAMPLE/HOLD
4	ANALOG INPUT	17	+5V SUPPLY
5	-5V SUPPLY	16	GROUND
6	DO NOT CONNECT	15	EXT. CAPACITOR
7	-5V SUPPLY	14	GROUND
8	DO NOT CONNECT	13	+5V SUPPLY
9	-5V SUPPLY	12	+5V SUPPLY
10	-5V SUPPLY	11	ANALOG OUTPUT

The SHM-12 is built using a fast complementary bipolar process. The device is available in both military and industrial temperature ranges. The SHM-12 is packaged in a 20-pin plastic SOIC or ceramic LCC.

# **TECHNICAL NOTES**

The SHM-12 employs an open loop architecture to achieve its superior high-speed characteristics. The first stage buffer amplifier incorporates the sample-and-hold switch. This allows for a fast acquisition time which is not limited by slew current like the traditional Schottky diode bridge switch. The output amplifier uses a closed loop voltage feedback design which provides a low  $(0.3\Omega, typical)$  output impedance. Gain and linearity are not affected by heavy loads.

The design has been optimized to achieve the high accuracy associated with fast transient responses over the military temperature range. During the track-to-hold transient, the integral nonlinearity is not affected and the pedestal remains constant over the full  $\pm 1.5V$  input range.

An innovative circuit design ensures an extremely low droop rate. An external hold capacitor can be added to the 15pF internal hold capacitor to obtain a lower droop rate (the droop rate is proportional to the inverse of the total hold capacitor value) without increasing transient response times by more than a few ns. The external hold capacitor should not exceed 100pF.

#### **GROUNDING AND LAYOUT**

Obtaining fully specified performance from the SHM-12 requires careful attention to pc-board layout and power supply decoupling.

For optimal performance, tie all grounds directly to a large analog ground plane beneath and around the package. Bypass all power supplies to ground with  $10\mu$ F tantalum capacitors in parallel with  $0.1\mu$ F ceramic capacitors.

Locate the bypass capacitors as close to the unit as possible.

For best performance, controlled impedance transmission line techniques, such as microstrip, should be used. Mount all components as close to the required pins as possible. It is strongly recommended that the SHM-12 not be socket-mounted.
