

### Low Voltage 2MHz Step-Up DC/DC Converter in SC70JW Package

### **General Description**

The AAT1265 is designed for single-cell or dual-cell alkaline, NiMH, or NiCd or single-cell lithium-ion/polymer (Li-Ion) battery-powered applications. It is a high efficiency, synchronous, fixed frequency, step-up converter with true output disconnect during shutdown (<1.0 $\mu$ A), start-up inrush current limit, and short-circuit protection.

The high 2MHz switching frequency and completely integrated control circuitry minimize the total solution footprint area while maintaining excellent regulation, ripple, and transient response throughout the full load range.

Light load switching frequency modulation and low quiescent current maintain high efficiency performance for light load and sleep mode conditions.

With a 1A peak switch current limit, the AAT1265 is capable of delivering 100mA to the load with a single AA cell, up to 250mA from a dual AA cell, or up to 400mA from a single-cell lithium-ion battery. The device has a 1.0V start-up voltage with operation down to 0.8V.

The AAT1265 is available in a Pb-free, space-saving 2.0x2.1mm 8-pin SC70JW package and is rated over the -40°C to +85°C temperature range.

#### **Features**

- 100mA Output from a Single AA Cell Input
- 250mA Output from a Dual AA Cell Input
- 400mA Output from a Single Lithium-Ion Cell Input
- V<sub>IN</sub> Operation Range: 0.8V to V<sub>OUT</sub>
- Up to 93% Efficiency
- Low Start-Up Voltage: 1.0V Typical
- Internal Synchronous Rectifier
- Current Mode Control with Internal Feedback and Compensation
- 2MHz Fixed Switching Frequency
- 1A Current Limit
- Maintains High Efficiency Over the Output Current Range for Improved Battery Life
- Low 40µA No Load Bias Current
- True Load Disconnect
- Short-Circuit and Over-Current Protection
- Inrush Current Limit and Soft Start
- Low Shutdown Current: <1.0μA
- -40°C to +85°C Temperature Range
- 2.0x2.1mm SC70JW-8 Package

#### **Applications**

- Bluetooth® Headsets
- Digital Cameras
- Medical Instruments
- Mobile Handsets
- MP3 and Portable Music Players

### **Typical Application**

# Low Voltage 2MHz Step-Up DC/DC Converter in SC70JW Package

# **Pin Descriptions**

Pin #	Symbol	Function			
1	VCC	Bias supply voltage after start-up and feedback to the output voltage error amplifier.			
2	EN	Enable pin. Logic high enables the IC. Logic low disables the IC and disconnects the load from the input. Shutdown current is $<1\mu$ A.			
3	VIN	Battery input voltage. Supplies the IC at start-up.			
4	LX	Inductor connection. Ties to the drains of the P-channel synchronous rectifier and the N-channel MOSFET switch.			
5	OUT	Boost converter output voltage; connects to the P-channel synchronous MOSFET source. Bypass with ceramic capacitor to GND.			
6, 7, 8	GND	Signal and power ground. Connect output capacitor return.			

### **Pin Configuration**

SC70JW-8 (Top View)

#### **Functional Block Diagram**

### **Functional Description**

The AAT1265 synchronous step-up converter is targeted for single- or dual-cell alkaline, NiMH, and NiCd and single-cell lithium-ion/polymer battery applications. It has a 1V typical start-up voltage with operation after start-up to less than 0.8V.

The high 2MHz switching frequency of the AAT1265 facilitates output filter component size reduction for improved power density and reduced overall footprint. It also provides greater bandwidth and improved transient response over other lower frequency step-up converters. The compensation and feedback is integrated with only three external components ( $C_{IN}$ ,  $C_{OUT}$ , L).

Low  $R_{\text{DS(ON)}}$  synchronous power switches provide high efficiency for heavy load conditions. Switching frequency modulation and low quiescent current maintains this high efficiency for light load and sleep mode conditions.

In addition to the improved efficiency, the synchronous boost has the added performance advantage of true load disconnect during shutdown ( $<1\mu$ A shutdown current), inrush current limit, and short-circuit protection.

#### PWM / Light Load Control

The AAT1265 is a fixed frequency PWM peak current mode control step-up converter. For light load conditions (10 to 20mA and below), the converter transitions to a variable

# Low Voltage 2MHz Step-Up DC/DC Converter in SC70JW Package

frequency (Light Load) mode to reduce the dominant switching losses. In addition to Light Load operation, a zero current comparator blocks reverse current in the P-channel synchronous MOSFET, forcing DCM operation at light load. These controls, along with very low quiescent current, help to maintain high efficiency over the complete load range without the compromise of increased output voltage ripple during light load conditions.

#### Start-up and Inrush Current Limit

The start-up sequence of the AAT1265 varies depending upon whether the input voltage is greater than or less than 2V. Above 1V, a start-up oscillator operating at 25% duty cycle controls the synchronous power stage and charges the output to 2V. For an input voltage greater than 2V, the output is charged at a constant current of 300mA until the output reaches a voltage level just below the input voltage. The step-up converter then takes control and continues to charge the output to the steady-state voltage. The step-up converter N-channel switch current is limited to 1A and the typical start-up time is 2.5ms.

#### **Shutdown and Output Disconnect**

A typical synchronous step-up (boost) converter has a conduction path from the input to the output via the body diode of the P-channel MOSFET. The AAT1265 design disconnects this body diode from the output and eliminates this conduction path. This enables the AAT1265 to provide true load disconnect during shutdown and inrush current limit at turn-on.

#### **Short-Circuit Protection**

The P-channel synchronous MOSFET body diode disconnect feature also gives the AAT1265 the ability to provide output short-circuit current limit protection.

#### **Applications Information**

#### **Inductor Selection**

The AAT1265 is designed to operate with a  $2.2\mu H$  inductor for all input/output voltage combinations. The inductor saturation current rating should be greater than the NMOS current limit specification listed in the Electrical Characteristics table. If necessary, the peak inductor current can exceed the saturation level by a small amount with no significant effect on performance. Table 1 provides a list of some suggested inductor manufacturers and their part numbers.

#### **Output and Input Capacitor Selection**

Surface mount X5R or X7R ceramic capacitors are suggested for both the output and the input. For the output capacitor (C1 in Figure 4) a 4.7 $\mu$ F, 10V, X5R ceramic capacitor is necessary for stability, transient response, and ripple performance. The same 0805 sized capacitor is used for the input (C2 of Figure 4). If desired, a smaller, 0603 sized, 4.7 $\mu$ F, 6.3V, X5R ceramic capacitor can be substituted for the input capacitor (C2). Suggested ceramic capacitor suppliers are listed in Table 1.

#### **PCB Layout Guidelines**

Figures 1, 2, and 3 display the evaluation board layout and suggested component placement. Due to the high switching speed of the AAT1265, it is important that the evaluation board layout be followed. Even the best switch-mode power supply design cannot overcome the problems that can be caused by a poor layout.

For the AAT1265, it is necessary that C1 and C2 be placed as close as possible to the IC with a good low impedance path to the GND pins of the IC. It is also good practice to minimize the length of the trace from the OUT pin to the output inductor. This prevents switching noise from radiating into other high noise sensitive, high impedance circuits.
