

1. DESCRIPTION

DMC6830 is a remote control transmitter, consists of the optimized 4-bit CPU with ROM and RAM. It contains power-on reset, watchdog timer and carrier frequency generator. The DMC6830 provide a various carrier frequency for encoding output of key matrix and has built-in transistor to drive infrared LED. The DMC6830 is supported with a software development tool, which allows code development in a PC environment. It allows the user to simulate the DMC6830 on an instruction level.

2. FEATURES

- Number of basic instructions----- 45
- Instruction cycle time (one word instruction)
 - At $F_{sys}=480\text{KHz}$ ----- 16.67 μS
 - At $F_{sys}=455\text{kHz}$ ----- 17.58 μS
- Memory size
 - ROM----- 1024 x 8 Bits
 - RAM----- 32 x 4 Bits
- Input ports (D0 ~ D3, E0 ~ E3 : with pull-up resistor)
- Output ports (C, G, K, F0 ~ F7)
- Carrier frequency generator
 - $F_{sys}/12$ (1/2 duty), $F_{sys}/12$ (1/3 duty), $F_{sys}/12$ (1/4 duty),
 - $F_{sys}/8$ (1/2 duty), $F_{sys}/8$ (1/4 duty), $F_{sys}/11$ (4/11 duty), No carrier
- Watchdog Timer
- Built-in power on reset
- Single power supply ----- 1.8V ~ 3.6V
- Power dissipation (stop mode , VDD = 3V)----- Less than 3 μW
- Package----- 20/24 DIP, 20/24 SOP
- Low-power system applications such as an infrared remote controller

- MASK OPTION
 - 1. Divide ratio of the oscillator frequency
 - 2. Whether connected infrared LED driver or not

※ Descriptions of this spec sheet assume that the DMC6830 include driver for infrared LED.

DMC 6830

3. BLOCK DIAGRAM

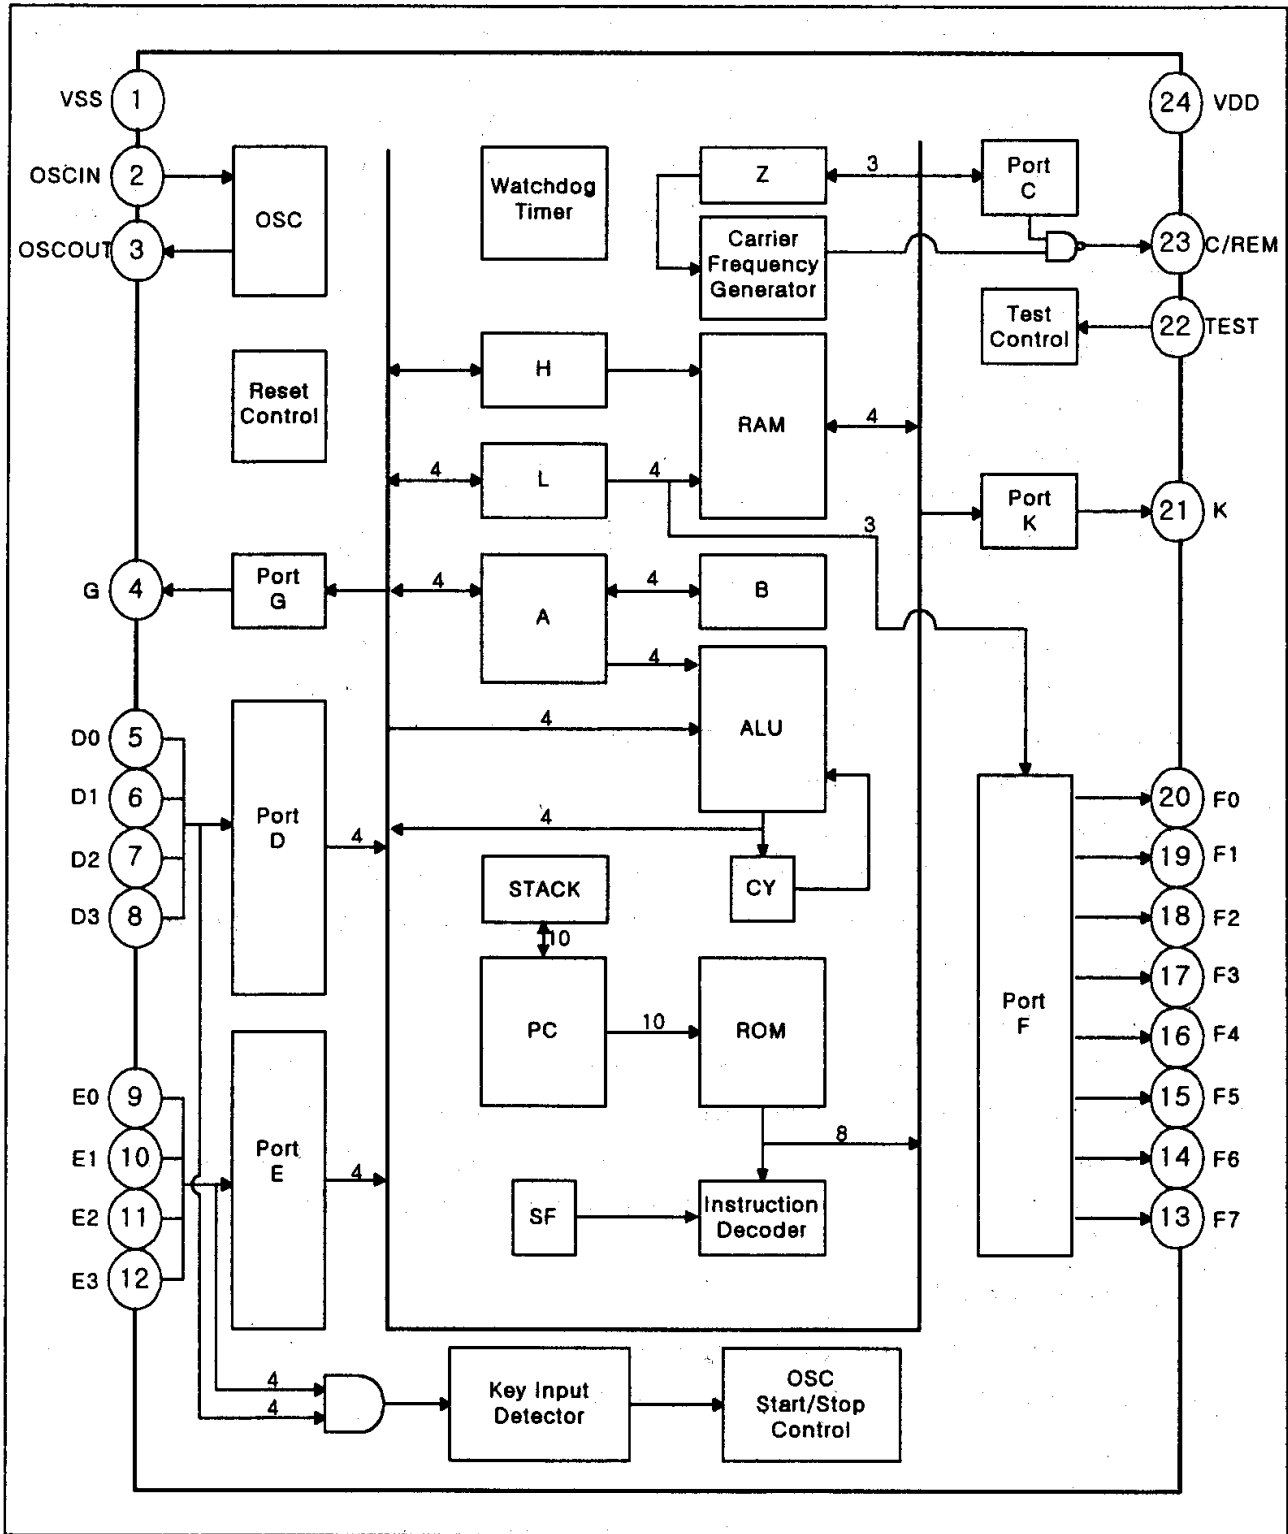

Figure 3.1 Block Diagram of the DMC6830

4. PIN ASSIGNMENT AND DESCRIPTION

4.1 PIN ASSIGNMENT FOR 24PINS (24 DIP, 24 SOP)

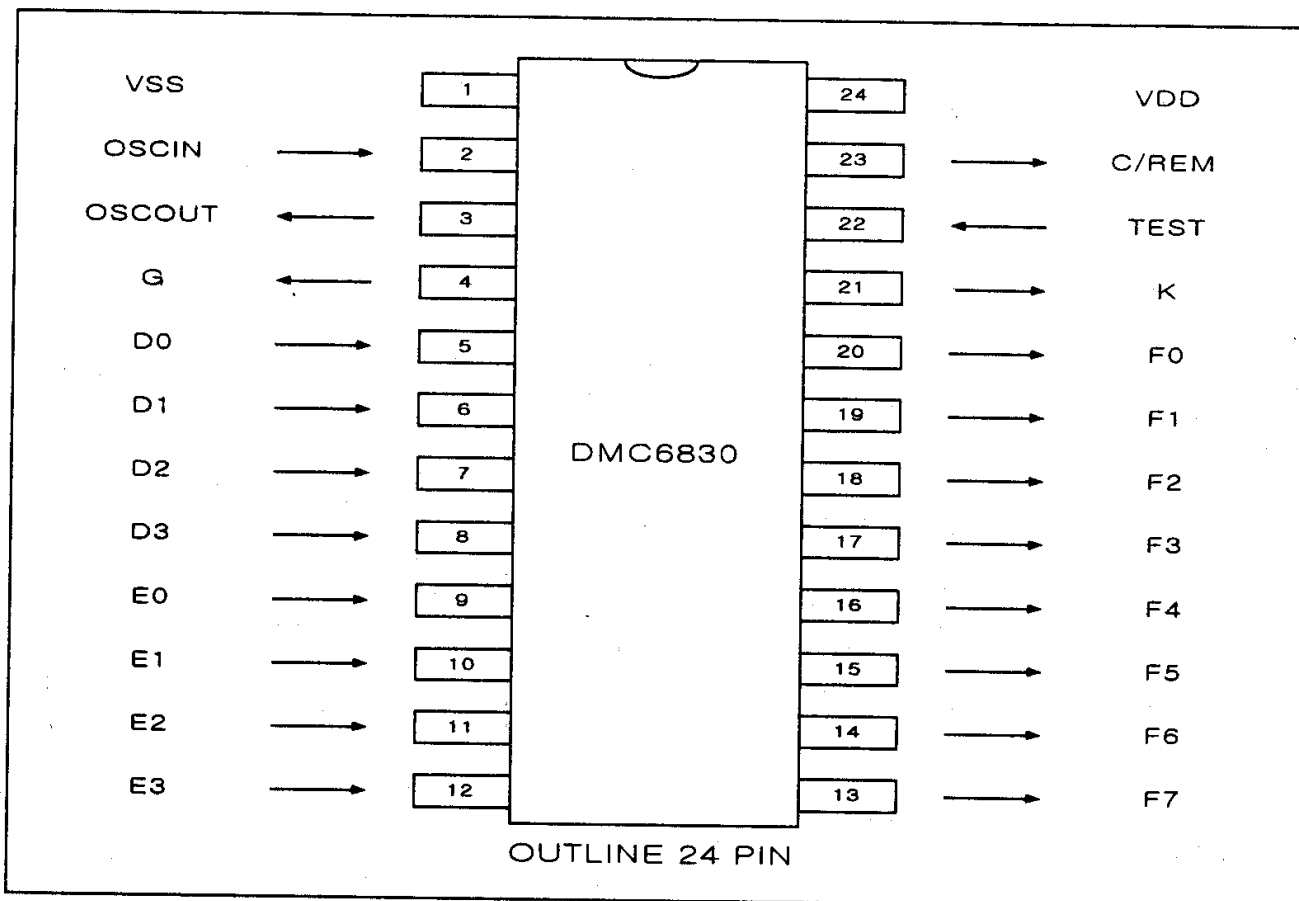

Figure 3-1. Pin Assignment of 24Pins

4.2 PIN DESCRIPTION FOR 24 PINS

Symbol	Pin No.	I/O	Functions	I/O Type
VDD	24	-	Power Supply	
VSS	1	-	Ground	
TEST	22	INPUT	Input for test (Normally connected to VSS)	
OSCIN	2	INPUT	Input for oscillating	
OSCOUT	3	OUTPUT	Output for oscillating	
C/REM	23	OUTPUT	1-Bit output for remote transmission	B
D0 - D3	5 - 8	INPUT	4-Bit input for key sense (with pull-up resistor)	A
E0 - E3	9 - 12	INPUT	4-Bit input for key sense (with pull-up resistor)	A
F0 - F7	20 - 13	OUTPUT	1-Bit individual output for key scan	C
G	4	OUTPUT	1-Bit output	D
K	21	OUTPUT	1-Bit output	D

4.3 PIN ASSIGNMENT (20 DIP, 20 SOP)

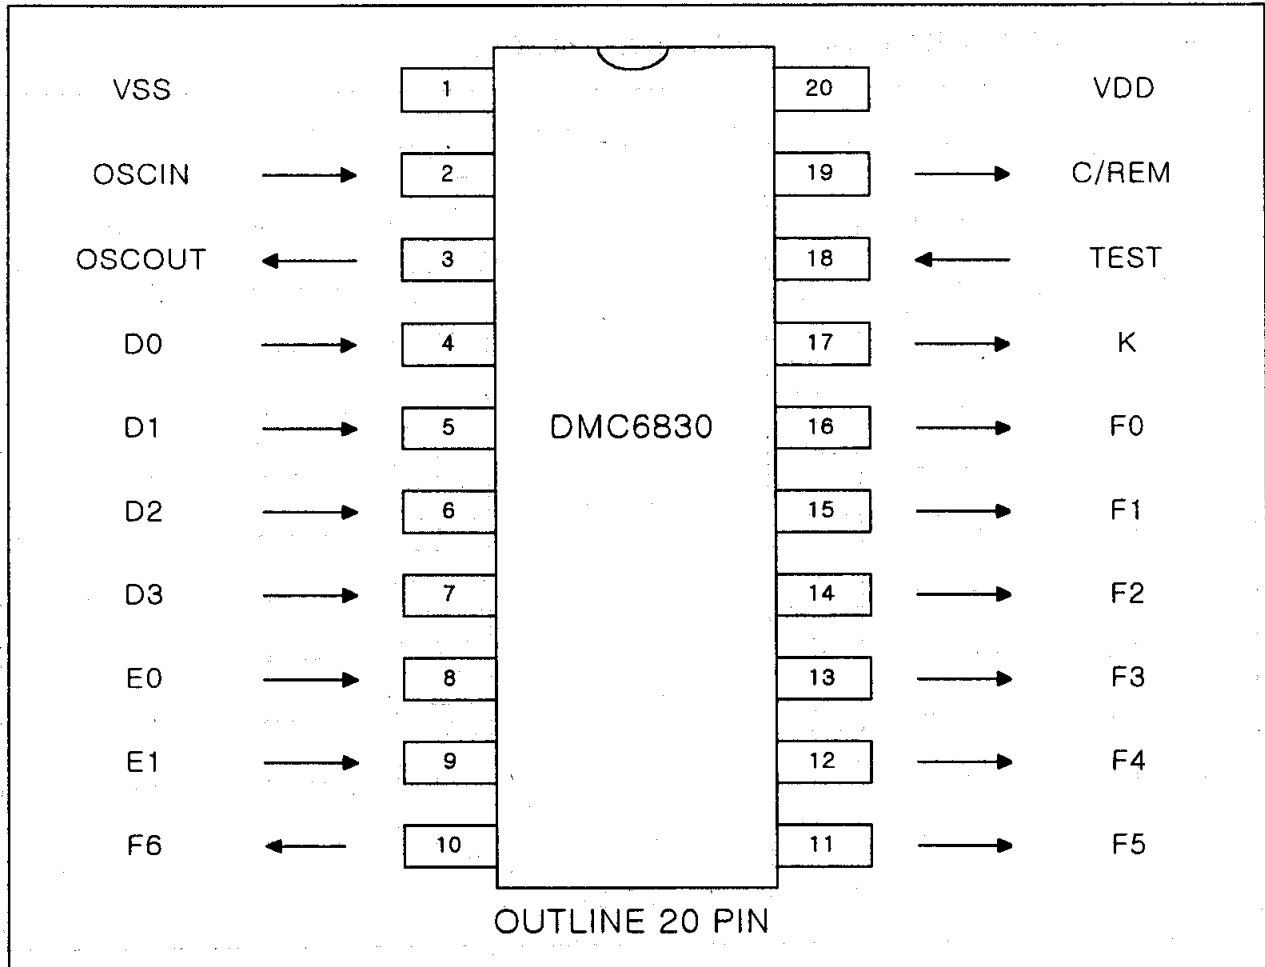

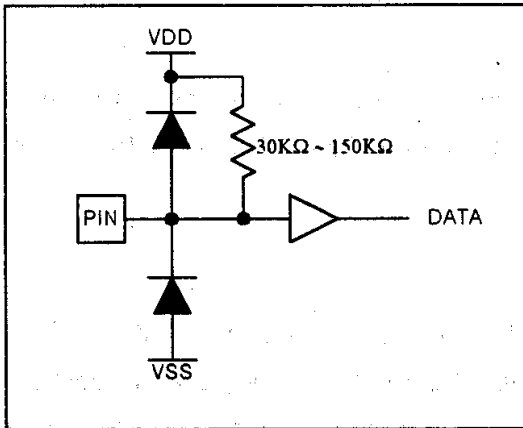

Figure 3-1. Pin Assignment of 20Pin

4.4 PIN DESCRIPTION FOR 20 PINS

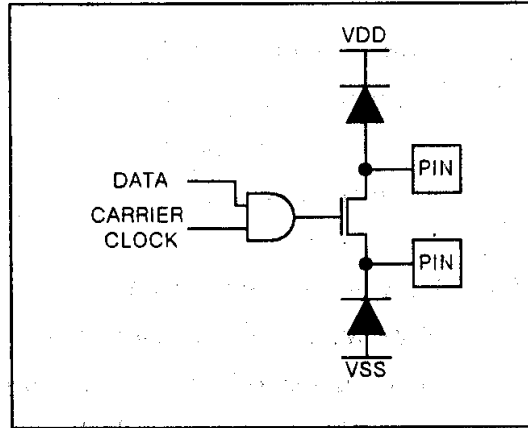

Symbol	Pin No.	I/O	Functions	I/O Type
VDD	20	-	Power Supply	
VSS	1	-	Ground	
TEST	18	INPUT	Input for test (Normally connected to VSS)	
OSCIN	2	INPUT	Input for oscillating	
OSCOUT	3	OUTPUT	Output for oscillating	
C/REM	19	OUTPUT	1-Bit output for remote transmission	B
D0 - D3	4 - 7	INPUT	4-Bit input for key scan (with pull-up resistor)	A
E0 - E1	8 - 9	INPUT	2-Bit input for key scan (with pull-up resistor)	A
F0 - F6	16 - 10	OUTPUT	1-Bit individual output for key scan	C
K	17	OUTPUT	1-Bit output	D

4.5 I/O CIRCUIT SCHEMATICS

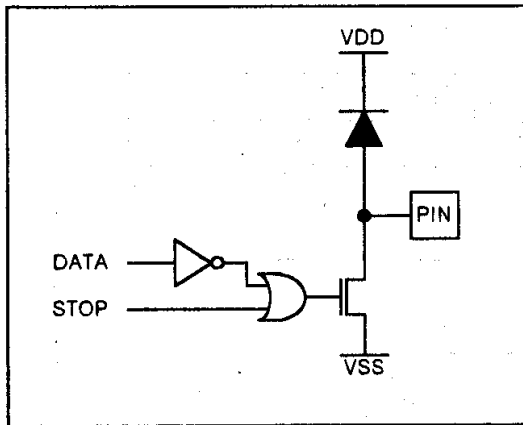

TYPE A

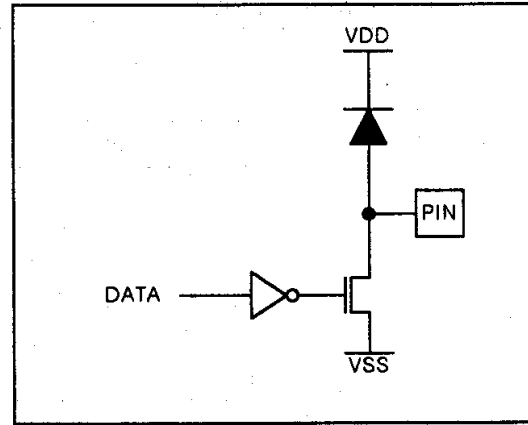

TYPE B

TYPE C

TYPE D

NOTE : If STOP mode is specified, the TYPE C output becomes "L" state and the TYPE B output becomes floating state, the TYPE D output maintains previous state.

Figure 3-1. I/O Circuit Schematics

5. BASIC FUNCTION BLOCK

5.1 Program Counter (PC)

Program counter is used to indicate the address of the next instruction to be executed. The 10-bit program counter consists of two registers, PC_H(4-bit) and PC_L(6-bit). This is a polynomial counter.

5.2 Program Memory (ROM)

Program memory is used to store user-specified program. This consists of a 1024 × 8-bit. It is organized in 16 pages and each page is 64 bytes long. For page-in addressing, all instructions excluding JMPL and CALL can be executed by page. In order to execute jump or call in page, JMP or CAL is suitable. For page-to-page addressing, JMPL or CALL must be used.

Figure 5-1. Program Memory Map

5.3 Data Memory (RAM)

Data memory is used to store various type of processing data. This consists of a 32-nibble, which is organized into two files of 16 nibbles each. RAM addressing is indirectly implemented by a two registers; H, L. It's upper 1-bit register (H) selects one of two files and its lower 4-bit register (L) selects one of 16 nibbles in the selected file.

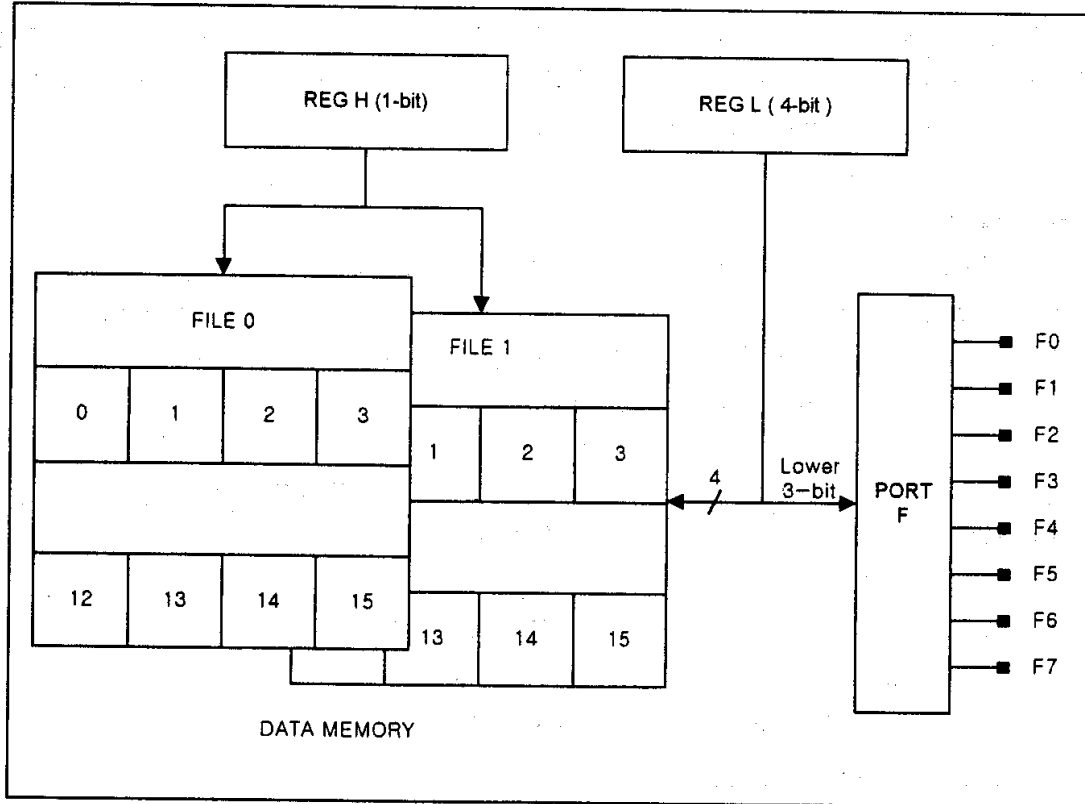

Figure 5-2. Data Memory Map

5.4 Stack Register (SK)

Stack register is used to store return address and provide a particularly mechanism for transferring control between programs. Two level hardware push/pop stacks are manipulated by CAL, CALL, and RET instructions. CAL/CALL instructions push the current program counter value, incremented by "1", into stack level 1. Stack level 1 is automatically pushed to level 2. If more than two subsequent CAL/CALL are executed, only the most recent two return addresses are stored. RET instruction load the contents of stack level 1 into the program counter while stack level 2 gets copied into level 1. If more than two subsequent RET are executed, the stack will be filled with the address previously stored in level 2.

5.5 Arithmetic and Logic Unit (ALU)

This unit is used to perform arithmetic and logical operations such as addition, comparison, and bit manipulation.

5.6 Carry Flag (CY)

The carry flag contains the carry generated by the arithmetic and logical unit immediately after an operation. The set carry (SETB CY) and clear carry (CLRB CY) instructions allow direct access for setting and clearing this flag.

5.7 Skip Flag (SF)

The skip flag is a 1-bit register, which enables programs to conditionally skip an instruction. All instructions are executed when this flag is "0". But if SF is "1", the program executes NOP instruction and resets SF to "0". Then program execution proceeds.

The following instructions affect the skip flag.

Instructions		Set conditions of SF
Arithmetic	ADD n INC L	If carry occurs (L) = 0
Compare	IFO @HL.b IFO CY IFEQU @HL IFEQU n	M[HL].b = 0 (CY) = 0 (A) = M[HL].b (A) = n
Data	STA @HL+	(L) = 0
Transfer	XCH @HL+	(L) = 0

The instructions, which doesn't affect the skip flag but have a skip condition, are as follows.

Instructions		Skip conditions
Data	LDA n	If it is continuous, skip next same instruction.
Transfer	LDL n	If it is continuous, skip next same instruction.
Bit Manipulate	SETB H CLRB H	If SETB H or CLRB H are continuous, skip next SETB H or CLRB H instruction.

5.8 Registers

Register A

Register A, called the accumulator, plays a central role, is used to store an input or an output operand (result) in the execution of most instructions. It consists of 4-bit.

Register B

Register B is used to store a temporary data in CPU. It consists of 4-bit.

Register H

Register H is used to indicate an address of the data memory in conjunction with register L. It consists of 1-bit, which is related with the bit 0 of accumulator.

Register L

Register L is used to indicate an address of the data memory in conjunction with register H, Also lower 3-bit can be used to indicate the bit position of the port F. It consists of 4-bit.

Register Z

Register Z is used to select a carrier frequency. The carrier frequency must be selected before Port C data write operation. It consists of 3-bit.

Register Z			Carrier frequency
Bit 2	Bit 1	Bit 0	
0	0	0	$F_{sys}/12$, 1/2 duty
0	0	1	$F_{sys}/12$, 1/3 duty
0	1	0	$F_{sys}/12$, 1/4 duty
0	1	1	$F_{sys}/8$, 1/2 duty
1	0	0	$F_{sys}/8$, 1/4 duty
1	0	1	$F_{sys}/11$, 4/11 duty
1	1	0	No carrier
1	1	1	No carrier

5.9 I/O Ports

Port C/REM

Port C/REM is a 1-bit output port, which is related with the bit 3 of accumulator, with CMOS N-channel open drain, which have large current sink capability, for I.R.LED drive. This output can be configured as carrier frequency by programming the register Z and port C data. This pin is put into the high-impedance state in stop mode.

Port D

Port D is a 4-bit input port with pull-up resistor. Forcing any input pins to "L" state, system reset occurs and it starts to operate from the reset address.

Port E

Port E is a 4-bit input port with pull-up resistor. Forcing any input pins to "L" state, system reset occurs and it starts to operate from the reset address.

Port F

Port F is an 8-bit output port with N-channel open drain. Each output which specified by the lower 3-bit of register L can be set and reset individually. All F pins are put into the low state in stop mode.

Port G

Port G is a 1-bit output port with N-channel open drain. When stop mode is specified, this pin still remains in the previous state. Set this pin to appropriate state before entering stop mode for visible LED or key scan application.

Port K

Port K is a 1-bit output port with N-channel open drain. When stop mode is specified, this pin still remains in the previous state. Set this pin to appropriate state before entering stop mode for visible LED or key scan application.

5.10 Carrier frequency generator

One of seven carrier frequencies can be selected and transmitted through the C/REM pin by programming the register Z and port C.

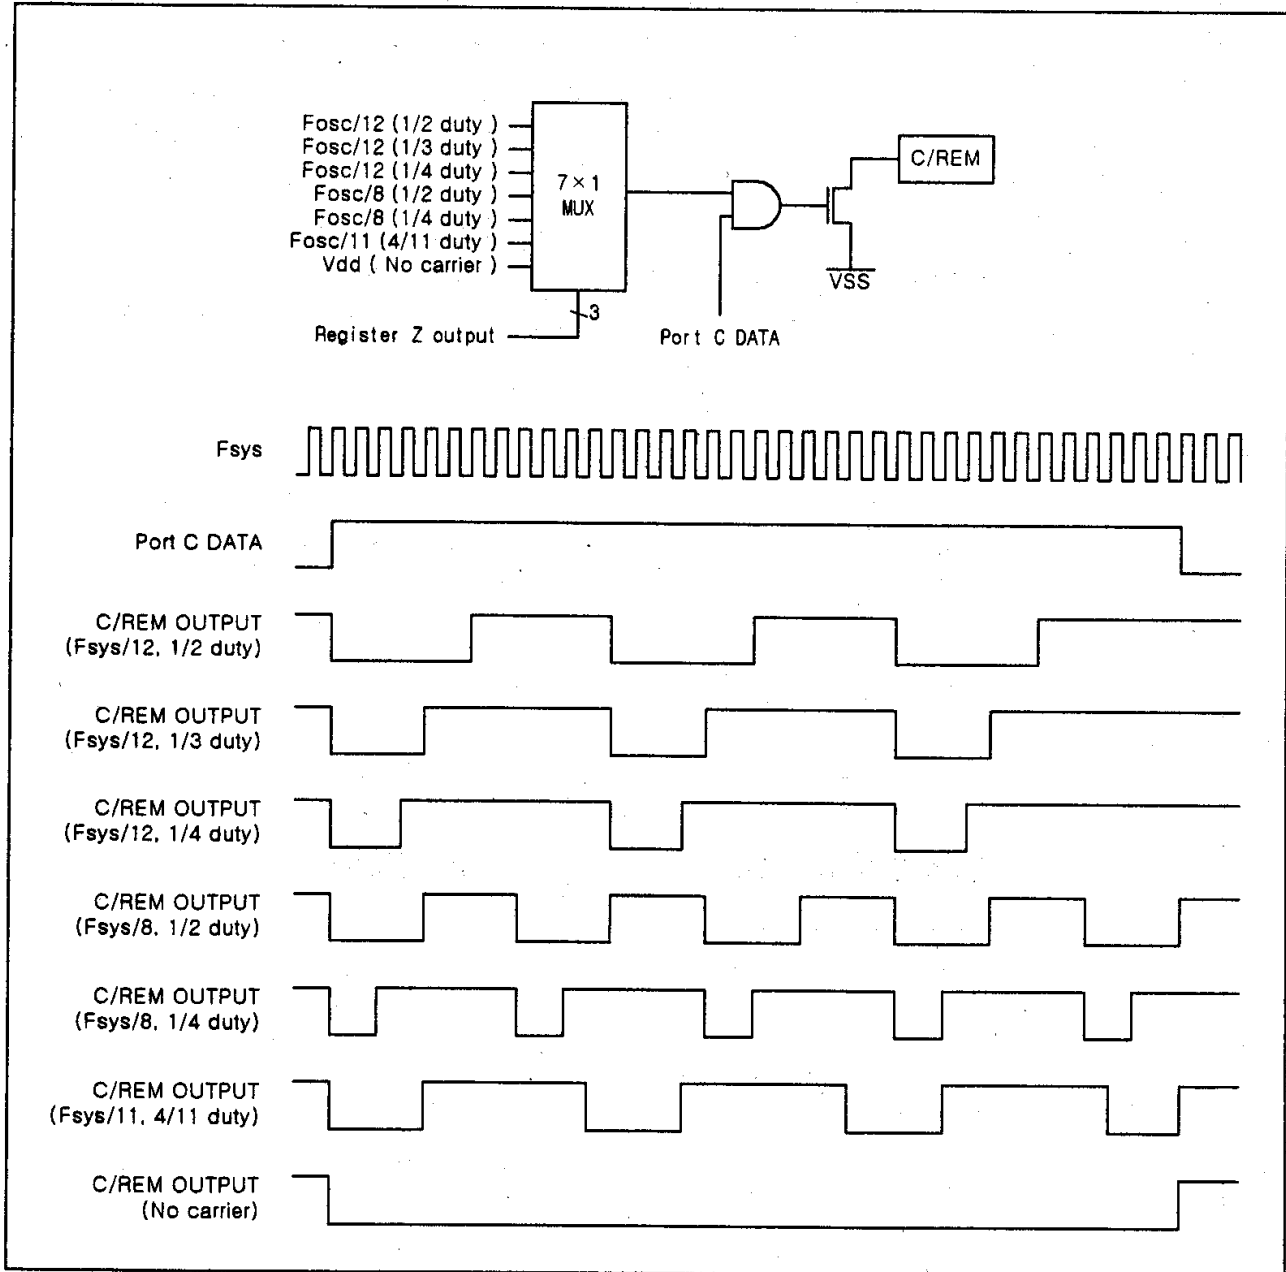

Figure 5-3 PORT C/REM and Carrier Output

5.11 Watchdog timer (WDT)

The watchdog timer provides the means to return to a reset condition when a system malfunction occurs and the program enters an infinite loop caused by noise or any abnormal state. Also this timer have a function of oscillation stabilization timer. This is a 13-bit counter, counts the clock which is divided twelve ($F_{SYS}/12$). In the stop mode the oscillation circuit stops but when a key input is detected (Port D, Port E) oscillation starts. When 12288 clock cycles have been counted, the program will be executed from reset address (000H). If the port C data register's value does not change from "L" to "H" before the timer counts 98304 clock cycles, a device reset condition is generated.

The oscillator stabilization time : $12/F_{SYS} * 2^{10} = 1/F_{SYS} * 12288 = 27\text{mS} (@455\text{KHz})$

The time-out period : $12/F_{SYS} * 2^{13} = 1/F_{SYS} * 98304 = 216\text{mS} (@455\text{KHz})$

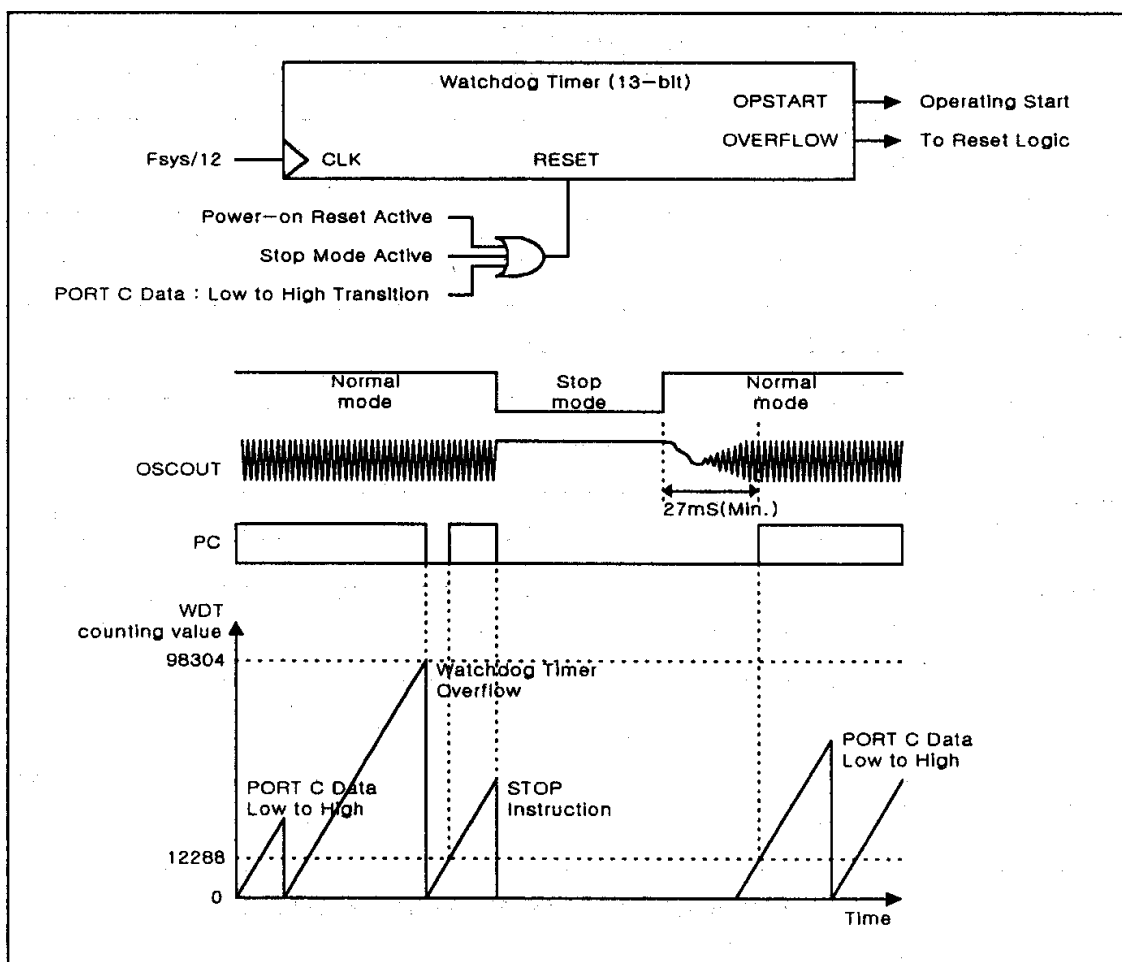

Figure 3-1. Function of Watchdog Timer

5.12 Power-on reset

The DMC6830 incorporates an on-chip power-on reset circuitry which provides internal chip reset for most power-up situations. The power-on reset circuit and the watchdog timer are closely related. On power-up the power-on reset circuit is active and watchdog timer is reset. After the reset time, which is in proportion to the rate of rise of VDD, watchdog timer begins counting. After the oscillator stabilization time, which is typically 27mS in $F_{SYS}=455\text{KHz}$, program execution proceeds from reset address (000H).

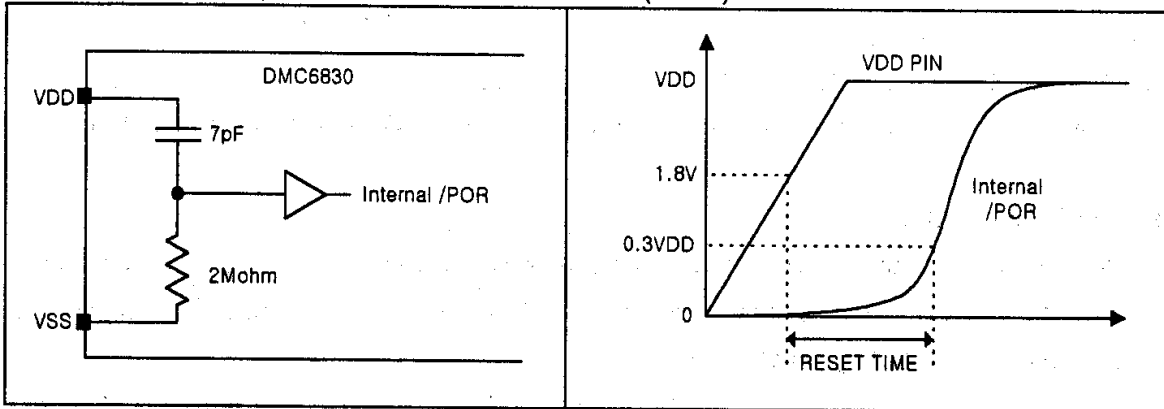

Figure 5-5. Built-in Power-on Reset

5.13 Stop mode

The DMC6830 support the stop mode to reduce power consumption. This mode is entered when the STOP instruction is executed during key inputs are not active. Activating any key inputs (Port D, Port E) the device is awakened from stop mode and restarts to operate from reset address. When the device is released from stop mode, following module's data must set to appropriate value in reset routine: PORT G and PORT K.

In stop mode, the oscillator is stopped and the each port state is as follows.

Port C/REM become inactive state. ("floating" for including I.R.LED driver, "L" otherwise)

Port F become "L" state ("floating" after the reset release)

Port G and Port K retain previous state.

Figure 5-6. Rest structure and Release Timing for STOP Mode to Normal Mode

5.14 OSC Divide Option

The OSC divide option provides a maximum 1MHz system clock (F_{SYS}). F_{OSC} which is generated in oscillation circuit is divided eight or non-divide to produce F_{SYS} . This dividing ratio will be selected by mask option.

F_{OSC} : Oscillator clock, F_{SYS} : System clock (F_{OSC} or $F_{OSC}/8$)

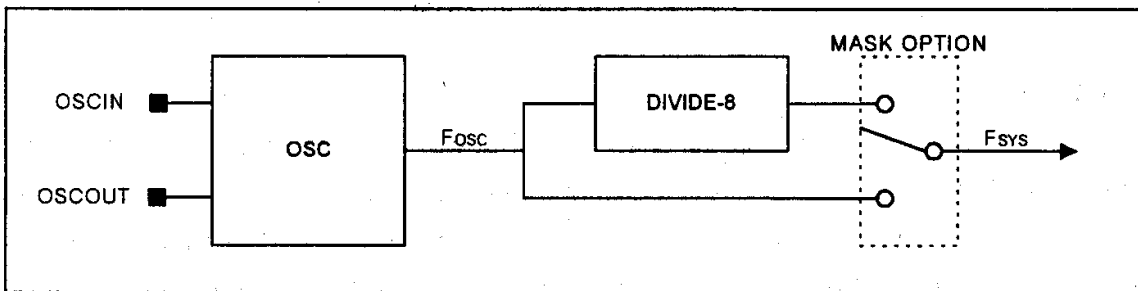

Figure 5-7. OSC Divide Option

6. ELECTRICAL SPECIFICATIONS

6.1 Absolute maximum ratings

Symbols	Parameters	Conditions	Ratings	Units
V_{DD}	Supply Voltage	$T_a=25^\circ\text{C}$	-0.3 ~ 6.0	V
V_I	Input Voltage		-0.3 ~ $V_{DD} + 0.3$	V
V_O	Output Voltage		-0.3 ~ $V_{DD} + 0.3$	V
T_{OPR}	Operating temperature	—	-20 ~ 85	$^\circ\text{C}$
T_{STG}	Storage Temperature	—	-40 ~ 125	$^\circ\text{C}$

6.2 Recommended operating conditions

($V_{DD} = 3V \pm 10\%$, $T_a = -20 \sim 70^\circ C$, unless otherwise noted)

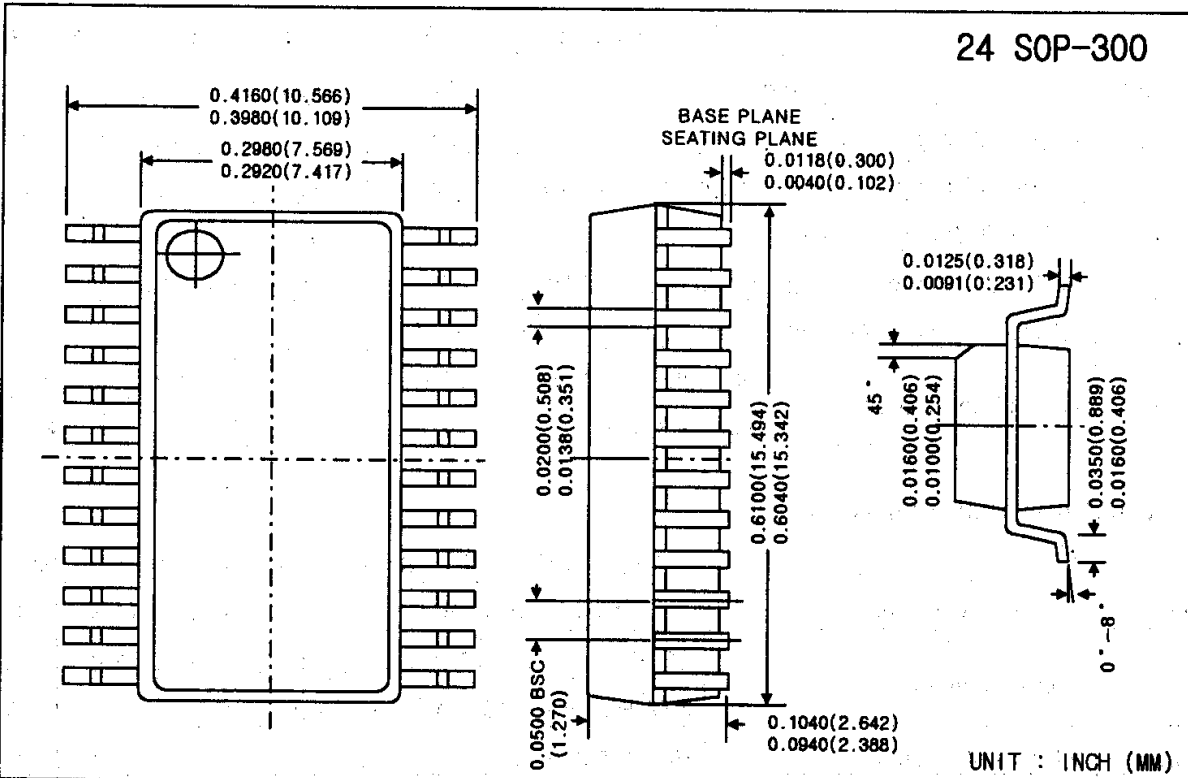

Symbols	Parameters	Min.	Typ.	Max.	Units
V_{DD}	Supply Voltage	1.8		3.6	V
V_{IH1}	"H" input Voltage, all input pins except OSCIN	$0.7V_{DD}$	V_{DD}	V_{DD}	V
V_{IH2}	"H" input Voltage, OSCIN	$V_{DD} - 0.3$	V_{DD}	V_{DD}	V
V_{IL1}	"L" input Voltage, all input pins except OSCIN	0	0	$0.3 V_{DD}$	V
V_{IL2}	"L" input Voltage, OSCIN	0	0	0.3	V
F_{OSC}	Oscillating frequency	Non-divide option	250	1000	KHz
		Divide-8 option	2	6	MHz

6.3 Electrical characteristics

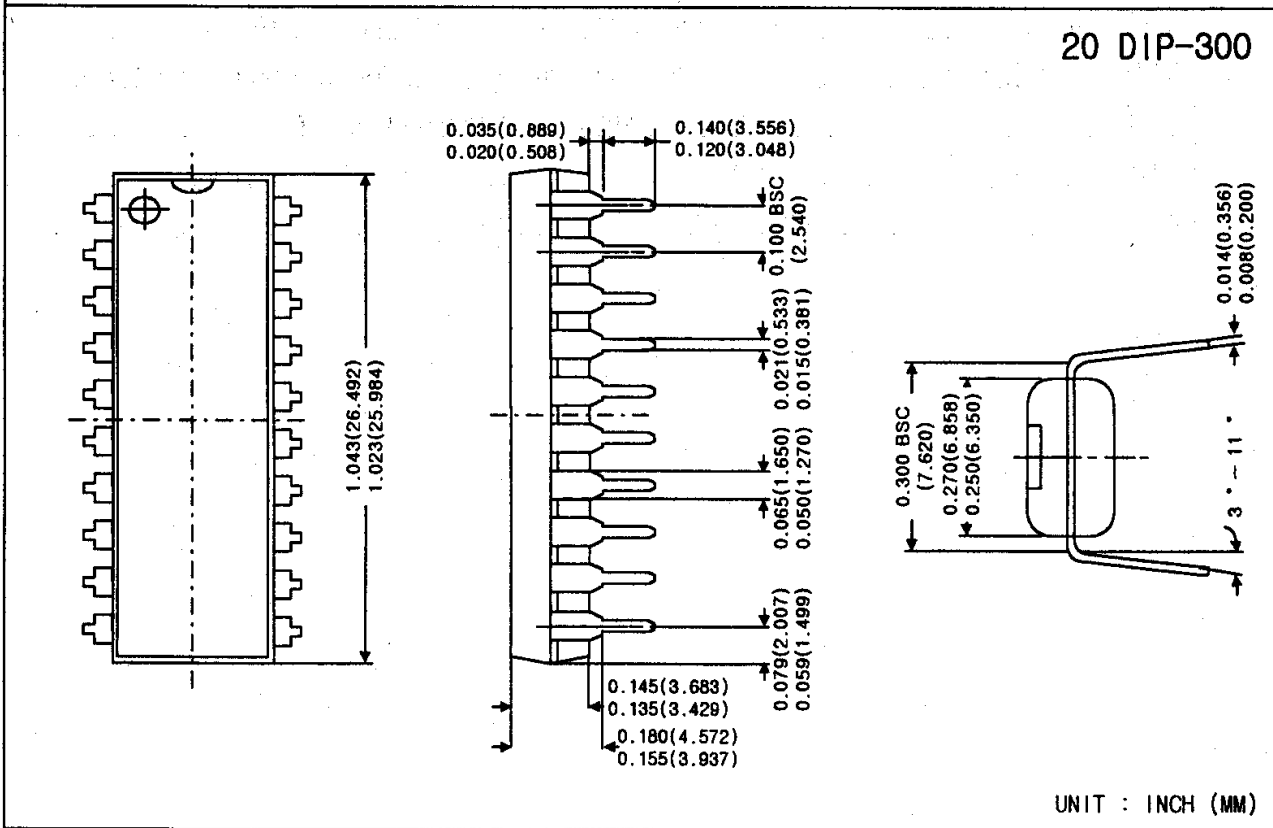

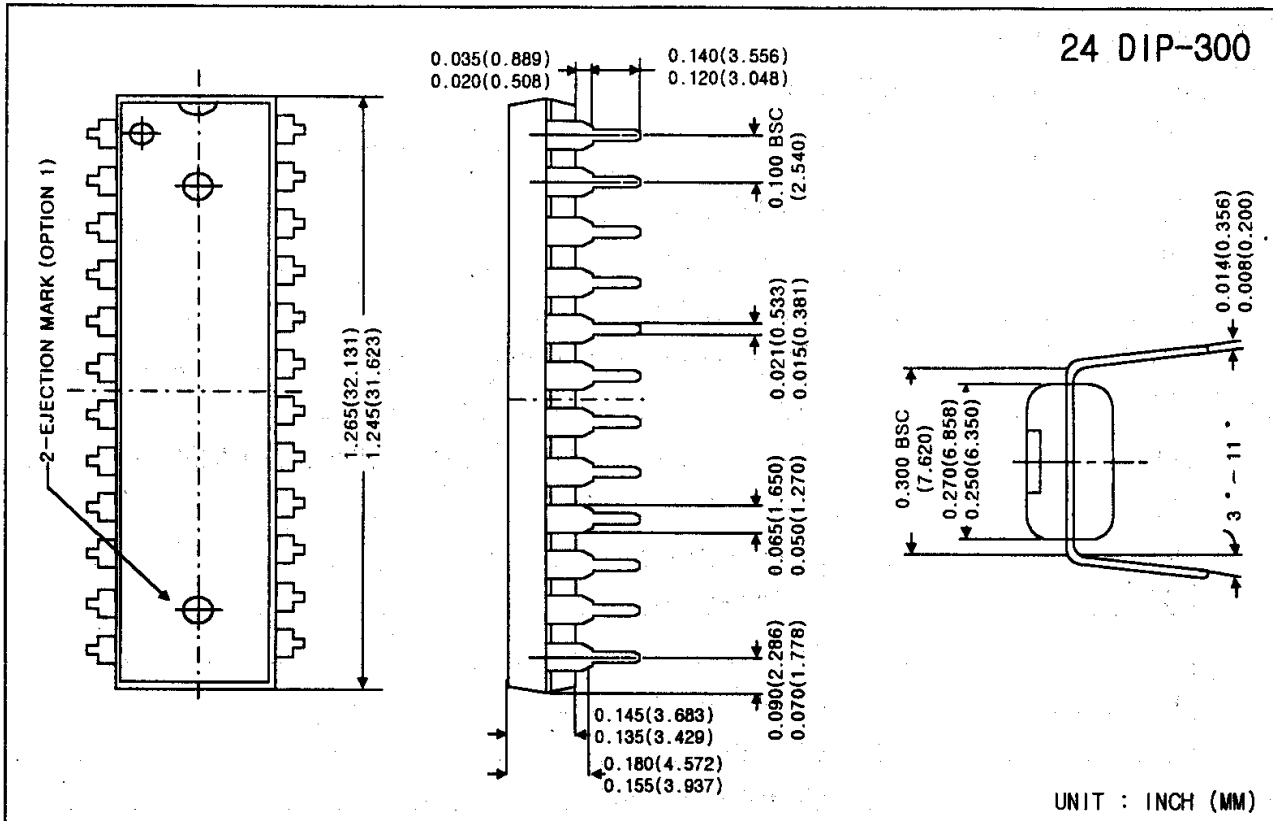

($V_{DD} = 3V \pm 10\%$, $T_a = 25^\circ C$, unless otherwise noted)

Symbols	Parameters	Test Conditions	Min.	Typ.	Max.	Units
V_{DD}	Supply Voltage	$250\text{KHz} \leq F_{OSC} \leq 3.9\text{MHz}$	1.8	3.0	3.6	V
		$3.9\text{MHz} < F_{OSC} < 6.0\text{MHz}$	2.2	3.0	3.6	V
I_{OH}	"H" output current	$V_O = 2.0V$, Port C	-6	-9	-14	mA
I_{OL0}	"L" output current	$V_O = 0.4V$, Port C	1.5	3	4.5	mA
I_{OL1}	"L" output current	$V_O = 0.4V$, Port C	180	210	240	mA
I_{OL2}		$V_O = 0.4V$, Port F	0.5	1.0	2.0	mA

8.3 INSTRUCTION DESCRIPTIONS

■ ADD n

Binary code : 0110xxxx
Syntax : [<label>] ADD n
Operation : $(A) \leftarrow (A) + n, n=0\sim 15$ (n must be decimal number)
Flags : CY: Unaffected.
SF: Set to one if carry occurs, cleared otherwise.
Words/Cycles: 1/1
Description : Adds an immediate data to the accumulator and stores the result in the accumulator.
Example :
ADD 8 ; Add 8 to A.
JMP 035 ; Jump to 035 if $0 \leq A \leq 7$
JMP 05F ; Jump to 05F if $8 \leq A \leq 15$

■ ADDC @HL

Binary code : 00010000
Syntax : [<label>] ADDC @HL
Operation : $(A) \leftarrow (A) + M[(HL)] + (CY), (CY) \leftarrow \text{Carry}$
Flags : CY: Set on carry-out of $(A) + M[(HL)] + (CY)$
SF: Unaffected
Words/Cycles: 1/1
Description : Adds the contents of the accumulator, the contents of data memory addressed by registers H and L, and the carry bit. It stores the result in the accumulator and the carry flag.
Example :
CLRB CY ; Clear CY to zero
LDA 5 ; Load 5 to A
CLRB H ; Clear H to zero
LDL 6 ; Load 6 to L
ADDC @HL ; Add the content of A, M[(06)], and the content of CY

■ CAL addr

Binary code : 11xxxxxx
Syntax : [<label>] CAL addr
Operation : $(SK1) \leftarrow (SK0), (SK0) \leftarrow (PC) + 1, (PCL) \leftarrow \text{addr}, \text{addr} = 000 \sim 03F$
(addr must be hexadecimal number)
Flags : CY: Unaffected
SF: Unaffected
Words/Cycles: 1/1
Description : Calls a subroutine located at the indicated address and pushes the current contents of the program counter to the top of stack. The indicated address must be within the current page.
Example : CAL 100 ; Call subroutine located at the 100. The 100 must be logical address and within the current page.

■ CALL addr

Binary code : 010100xx xxxxxxxx

Syntax : [<label>] CALL addr

Operation : (SK1) ← (SK0), (SK0) ← (PC) + 1, (PC) ← addr,
addr = 000 ~ 3FF (addr must be hexadecimal number)

Flags : CY: Unaffected
SF: Unaffected

Words/Cycles: 2/2

Description : Calls a subroutine located at the indicated address and pushes the current contents of the program counter to the top of stack. The indicated address can be anywhere in the full 1K-byte memory space.

Example : CALL 2FF ; Call subroutine located at the 2FF. The 2FF must be logical address.

■ CLRB @HL.b

Binary code : 010110xx

Syntax : [<label>] CLRB @HL.b

Operation : M[(HL).b] ← 0

Flags : CY: Unaffected
SF: Unaffected

Words/Cycles: 1/1

Description : Clears the specified bit of data memory addressed by registers H and L to zero.

Example : CLRB H ; Clear H to 0

LDL 10 ; Load 10 to L. The 10 must be decimal number.

CLRB @HL.0 ; Clear the bit 0 of M[(0A)] to 0.

■ CLRB CY

Binary code : 00001000

Syntax : [<label>] CLRB CY

Operation : (CY) ← 0

Flags : CY: Set to zero
SF: Unaffected

Words/Cycles: 1/1

Description : Clears the carry flag to zero.

Example : CLRB CY ; Clear CY to zero

■ CLRB F

Binary code : 00001010
Syntax : [<label>] CLRB F
Operation : $F.(L) \leftarrow 0$
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Clears the specified bit of port F addressed by the lower 3-bit of register L to zero.
Example : LDL 13 ; Load 13 to L
 CLRB F ; Clears the bit 5 of F to zero

■ CLRB G

Binary code : 00101100
Syntax : [<label>] CLRB G
Operation : $(G) \leftarrow 0$
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Clears the port G to zero.
Example : CLRB G ; Clear G to zero

■ CLRB H

Binary code : 00100100
Syntax : [<label>] CLRB H
Operation : $(H) \leftarrow 0$
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Clears the contents of register H to zero. Skip this instruction if it or SETB H was used just before.
Example : IFEQU 1
 CLRB H ; Clear H to zero and skip continuous SETB H/CLRB H, if (A)≠1
 SETB H ; Sets H to one and skip continuous SETB H/CLRB H, if (A)=1

■ CLRB K

Binary code : 00101110
Syntax : [<label>] CLRB K
Operation : (K) ← 0
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Clears the port K to zero.
Example : CLRB K ; Clear K to zero.

■ IF0 @HL.b

Binary code : 000001xx
Syntax : [<label>] IF0 @HL.b
Operation : M[(HL)b] = 0
Flags : CY: Unaffected
 SF: Set to one if equal, cleared otherwise
Words/Cycles: 1/1
Description : Compares the specified bit of data memory addressed by registers H and L with zero.
Example : SETB H ; Set H to one
 LDL 4 ; Load 4 to L
 IF0 @HL.3 ; Compare the bit 3 of M[(14)] with zero
 JMP 020 ; Jump to 020 if not equal
 JMP 030 ; Jump to 030 if equal

■ IF0 CY

Binary code : 00011100
Syntax : [<label>] IF0 CY
Operation : (CY) = 0
Flags : CY: Unaffected
 SF: Set to one if equal, cleared otherwise
Words/Cycles: 1/1
Description : Compares the carry flag with zero.
Example : IF0 CY ; Compare the content of CY to zero
 JMP 030 ; Jump to 030 if not equal
 JMP 040 ; Jump to 040 if equal

■ IFEQU @HL

Binary code : 00001111

Syntax : [<label>] IFEQU @HL

Operation : (A) = M[(HL)]

Flags : CY: Unaffected

SF: Set to one if equal, cleared otherwise

Words/Cycles: 1/1

Description : Compares the contents of accumulator with the contents of data memory addressed by registers H and L.

Example : LDA 14 ; Load 14 to A, and 14 must be decimal number
SETB H ; Sets H to one
LDL 4 ; Loads 4 to L
IFEQU @HL ; Compares 14 with M[(14)]
JMP 050 ; Jump to 050 if not equal
JMP 060 ; Jump to 060 if equal

■ IFEQU n

Binary code : 00001110 0111xxxx

Syntax : [<label>] IFEQU n

Operation : (A) = n, n = 0 ~15 (n must be decimal number)

Flags : CY: Unaffected

SF: Set to one if equal, cleared otherwise

Words/Cycles: 2/2

Description : Compares the contents of accumulator with an immediate data.

Example : IFEQU 15 ; Compare the contents of accumulator with 15
JMP 070 ; Jump to 070 if not equal
JMP 080 ; Jump to 080 if equal

■ INC L

Binary code : 00100010

Syntax : [<label>] INC L

Operation : (L) ← (L) + 1

Flags : CY: Unaffected

SF: As a result of execution, set to one if the contents of register L are zero, cleared otherwise.

Words/Cycles: 1/1

Description : The contents of register L are incremented by one.

Example : LDL 14 ; Load 14 to L
INC L ; The contents of L are incremented by one
INC L ; The contents of L are incremented by one
JMP 090 ; It is skipped because the contents of L is "0"
JMP 0A0 ; Jump to 0A0

■ JMP addr

Binary code : 10xxxxxx

Syntax : [<label>] JMP addr

Operation : (PCL) ← addr, addr = 00 ~ 3F (addr must be hexadecimal number)

Flags : CY: Unaffected
SF: Unaffected

Words/Cycles: 1/1

Description : Jumps unconditionally to the indicated address. The indicated address must be within the current page.

Example : JMP 2EF ; Jump unconditionally to the 2EF. The 2EF address must be within the current page.

■ JMPL addr

Binary code : 010101xx xxxxxxxx

Syntax : [<label>] JMPL addr

Operation : (PC) ← addr, addr = 000 ~ 3FF (addr must be hexadecimal number.)

Flags : CY: Unaffected
SF: Unaffected

Words/Cycles: 2/2

Description : Jumps unconditionally to the indicated address. The indicated address can be anywhere in the full 1K-byte memory space.

Example : JMPL 100 ; Jump unconditionally to 100

■ LDA @HL

Binary code : 00100011

Syntax : [<label>] LDA @HL

Operation : (A) ← M[(HL)]

Flags : CY: Unaffected
SF: Unaffected

Words/Cycles: 1/1

Description : Loads the contents of memory addressed by registers H and L into the accumulator.

Example : SETB H ; Set H to 1
LDL 0 ; Load 0 to L
LDA @HL ; Load M[(10)] into A

■ LDA n

Binary code : 0111xxxx

Syntax : [<label>] LDA n

Operation : (A) ← n, n=0~15 (n must be decimal number.)

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Loads an immediate data into the accumulator. Skip this instruction if it was used just before.

Example : STA B
LDA 15 ; Load 15 into A.
LDA 4 ; It is skipped because this instruction was used just before
LDA 7 ; It is skipped because this instruction was used just before
JMP 0B0 ; Jump to 0B0

■ LDA B

Binary code : 00010101

Syntax : [<label>] LDA B

Operation : (A) ← (B)

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Loads the contents of register B into the accumulator.

Example : LDA B ; Load the contents of B into A

■ LDA D

Binary code : 00010100

Syntax : [<label>] LDA D

Operation : (A) ← (D)

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Loads the contents of port D into the accumulator.

Example : LDA D ; Load the contents of D into A

■ LDA E

Binary code : 00010010
Syntax : [<label>] LDA E
Operation : (A) ← (E)
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Loads the contents of port E into the accumulator.
Example : LDA E ; Load the contents of E into A

■ LDA H

Binary code : 00010001
Syntax : [<label>] LDA H
Operation : (A) ← (H)
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Loads the contents of register H into the bit 0 of accumulator.
Example : LDA H ; Load the content of H into the bit 0 of A

■ LDA L

Binary code : 00010110
Syntax : [<label>] LDA L
Operation : (A) ← (L)
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Loads the contents of register L into the accumulator.
Example : LDA L ; Load the contents of L into A

■ LDL n

Binary code : 0100xxxx

Syntax : [<label>] LDL n

Operation : $(A) \leftarrow n$, $n = 0 \sim 15$ (n must be decimal number)

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Loads an immediate data to the register L. Skip this instruction if it was used just before.

Example : LDA 3

LDL 8 ; Load 8 to L

LDL 4 ; It is skipped because this instruction was used just before

JMP 0C0 ; Jump to 0C0

■ LDZ n

Binary code : 00110xxx

Syntax : [<label>] LDZ n

Operation : $(A) \leftarrow n$, $n = 0 \sim 7$ (n must be decimal number)

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Load an immediate data into the register Z.

Example : LDZ 0 ; Load 0 into Z. The 0 must be decimal number

■ NOP

Binary code : 00000000

Syntax : [<label>] NOP

Operation : $(PC) \leftarrow (PC) + 1$

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : No operation.

Example : NOP ; No operation

■ NOT

Binary code : 00010111
Syntax : [<label>] NOT
Operation : $(A) \leftarrow \neg(A)$
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : The contents of accumulator are 1's complemented.
Example : LDA 7
 NOT ; 1's complement 7, then leaves 8 in A

■ RET

Binary code : 00011101
Syntax : [<label>] RET
Operation : $(PC) \leftarrow (SK0), (SK0) \leftarrow (SK1)$
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Returns from the subroutine to main routine.
Example : RET ; Returns from the subroutine to main routine

■ RRC

Binary code : 00010011
Syntax : [<label>] RRC
Operation : $(A.b) \leftarrow (A.b+1) \quad (A.3) \leftarrow (CY) \quad (CY) \leftarrow (A.0)$
Flags : CY: Set to bit 0 of the accumulator
 SF: Unaffected
Words/Cycles: 1/1
Description : Shifts the contents of accumulator 1-bit to the right through the carry.
The carry bit content shifts into the bit 3 of accumulator, and the bit 0 of accumulator is shifted into the carry bit.
Example : SETB CY ; Set CY to one.
 LDA 5 ; Load 5 to A
 RRC ; CY becomes zero, and the contents of A is 11

■ SETB @HL.b

Binary code : 010111xx

Syntax : [<label>] SETB @HL.b

Operation : M[(HL)].b ← 1

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Sets the specified bit of memory addressed by registers H and L to one.

Example : CLR B H ; Clear H to zero

LDL 5 ; Load 5 to L

SETB @HL.2 ; Set the bit 2 of M[(05)] to one

■ SETB CY

Binary code : 00001001

Syntax : [<label>] SETB CY

Operation : (CY) ← 1

Flags : CY: Set to one

SF: Unaffected

Words/Cycles: 1/1

Description : Sets the contents of carry flag to one.

Example : SETB CY ; Sets the content of CY to one

■ SETB F

Binary code : 00001011

Syntax : [<label>] SETB F

Operation : F.(L) ← 1

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Sets the specified bit of the port F addressed by register L to one.

Example : LDL 4 ; Loads 4 to L

SETB F ; Sets the bit 4 of F to one

■ SETB G

Binary code : 00101101
Syntax : [<label>] SETB G
Operation : (G) ← 1
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Sets the port G to one.
Example : SETB G ; Sets the port G to one

■ SETB H

Binary code : 00100101
Syntax : [<label>] SETB H
Operation : (H) ← 1
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Sets the contents of register H to one. Skip this instruction if it or SETB H was used just before.
Example : IFEQU 1
 SETB H ; Sets H to one and skip continuous CLRB H/SETB H, if (A)≠1
 CLRB H ; Clear H to zero and skip continuous CLRB H/SETB H, if (A)=1

■ SETB K

Binary code : 00101111
Syntax : [<label>] SETB K
Operation : (K) ← 1
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Sets the port K to one.
Example : SETB K ; Sets the port K to one

■ STA @HL

Binary code : 00101001

Syntax : [<label>] STA @HL

Operation : $M[(HL)] \leftarrow (A)$

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Stores the contents of accumulator in memory addressed by registers H and L.

Example :
LDL 0 ; Load 0 to L
SETB H ; Set H to one
STA @HL ; Stores the contents of A in M[(10)]

■ STA @HL+

Binary code : 00101000

Syntax : [<label>] STA @HL+

Operation : $M[(HL)] \leftarrow (A), (L) \leftarrow (L) + 1$

Flags : CY: Unaffected

SF: As a result of execution, set to one if the contents of register L are zero, cleared otherwise

Words/Cycles: 1/1

Description : Stores the contents of accumulator in memory addressed by registers H and L. And then the contents of register L are incremented by one.

Example :
LDL 15 ; Load 15 to L
SETB H ; Set H to one
STA @HL+ ; Stores the contents of A in M[(1F)]. L becomes "0"
JMP 035 ; It is skipped because L is "0"
JMP 045 ; Jump to 045

■ STA B

Binary code : 00011110

Syntax : [<label>] STA B

Operation : $(B) \leftarrow (A)$

Flags : CY: Unaffected

SF: Unaffected

Words/Cycles: 1/1

Description : Stores the contents of accumulator in the register B.

Example : STA B ; Stores the contents of A in B

■ STAC

Binary code : 00001100
Syntax : [<label>] STAC
Operation : $(C) \leftarrow (A)_3$
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Stores the bit 3 of accumulator in the port C.
Example : STAC C ; Stores the bit 3 of A in C

■ STAH

Binary code : 00000011
Syntax : [<label>] STAH
Operation : $(H) \leftarrow (A)_0$
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Stores the bit 0 of accumulator in the register H.
Example : STAH H ; Store the bit 0 of A in H

■ STAL

Binary code : 00011111
Syntax : [<label>] STAL
Operation : $(L) \leftarrow (A)$
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Stores the contents of accumulator in the register L.
Example : STAL L ; Stores the contents of A in L

■ STOP

Binary code : 00000001
Syntax : [<label>] STOP
Operation : Stop the oscillation of the oscillator, and reset PORT F to zero
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Stops the oscillation of the oscillator.
Example : STOP

■ XCH @HL

Binary code : 00100001
Syntax : [<label>] XCH @HL
Operation : (A) ↔ M[(H,L)]
Flags : CY: Unaffected
 SF: Unaffected
Words/Cycles: 1/1
Description : Exchanges the accumulator with the contents of the data memory addressed by registers H and L without going through an intermediate location.
Example : LDL 3 ; Load 3 to L
 SETB H ; Set H to one
 XCH @HL ; Exchanges the contents of A with M[(13)] without going through an intermediate location

■ XCH @HL+

Binary code : 00100000
Syntax : [<label>] XCH @HL+
Operation : (A) ↔ M[(H,L)], (L) ← (L) + 1
Flags : CY: Unaffected
 SF: As a result of execution, set to one if the contents of register L are zero, cleared otherwise
Words/Cycles: 1/1
Description : Exchanges the accumulator with the contents of the data memory addressed by registers H and L without going through an intermediate location. As a result of execution, the contents of register L are incremented by one.
Example : SETB H ; Set H to one
 LDL 15 ; Load 15 into L
 XCH @HL+ ; Exchanges A with M[(1F)] without going through an intermediate location. As a result of execution, the contents of L are "0"
 JMP 055 ; It is skipped because L is "0"
 JMP 065 ; Jump to 065
