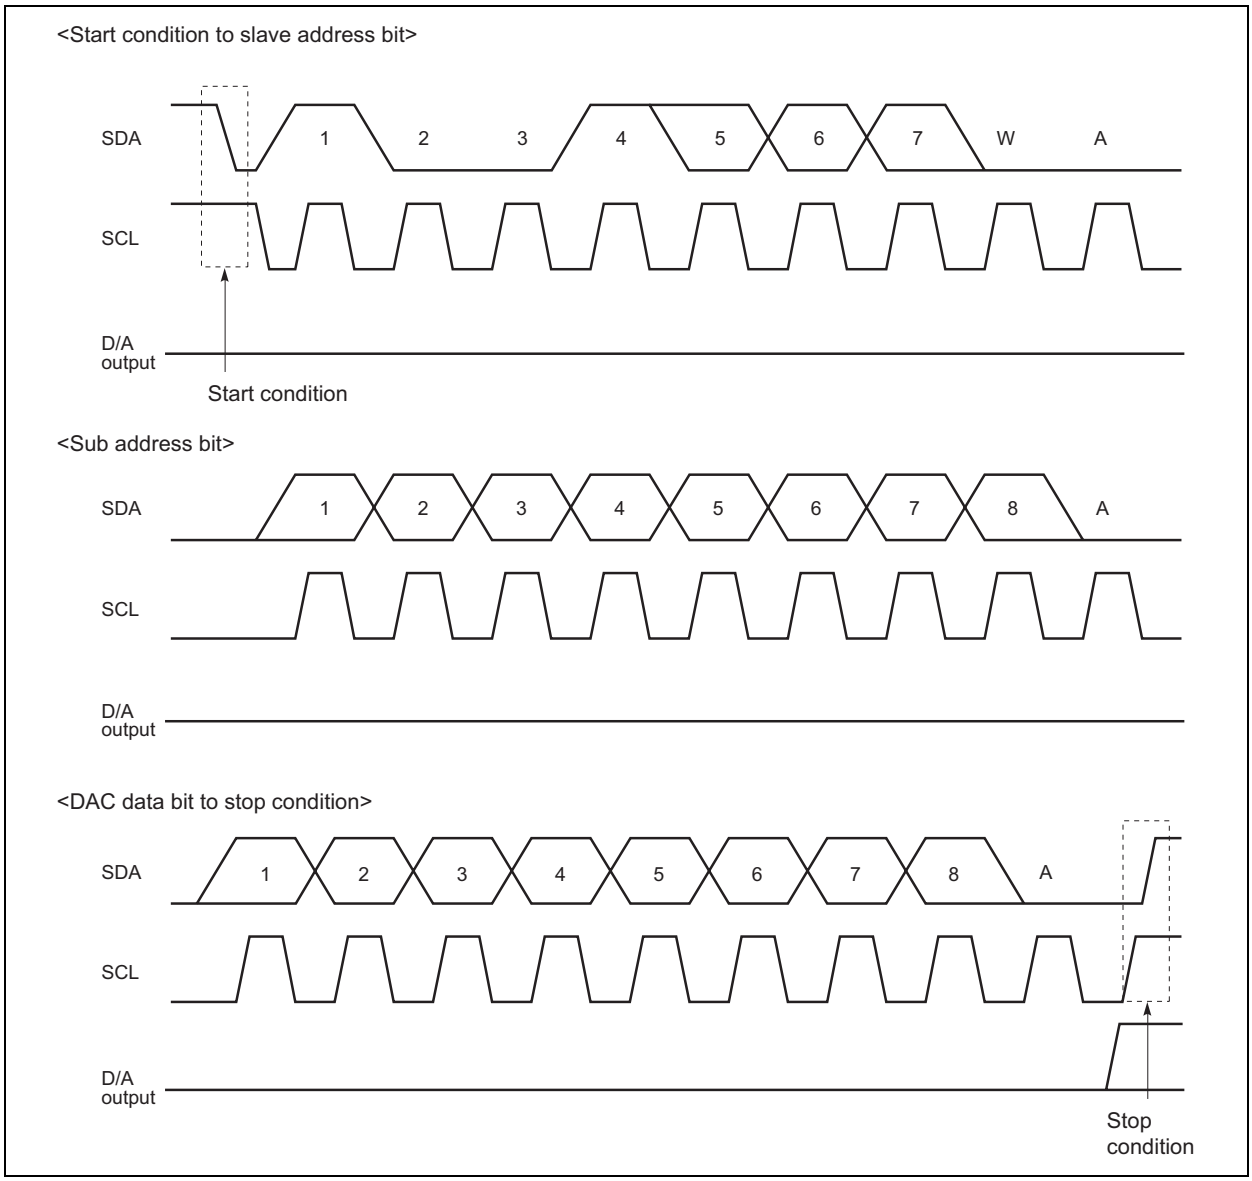
Timing Chart (Model)



- Start condition With SCL at High, SDA line goes from High to Low
- Stop condition With SCL at High, SDA line goes from Low to High
  (Under normal circumstance, SDA is changed when SCL is Low)
- Acknowledge bit The receiving IC has to pull down SDA line whenever receive slave data.
  (The transmitting IC releases the SDA line just then transmit 8-bit data.)

Precaution For use

- Supply voltage terminal (V_{CC}) is also used for D/A converter upper reference voltage setting. If ripple or spike is input this terminal, accuracy of D/A conversion is down. So, when use this device, please connect capacitor among V_{CC} to GND for stable D/A conversion.
- This IC's output amplifier has an advantage to capacitive load. So it's no problem at device action when connect capacitor (0.1 μF Max) among output to GND for every noise eliminate.
- Purchase of Renesas's I^2C components conveys a license under the Philips I^2C Patent Rights to use these components an I^2C system, provided that the system conforms to I^2C Standard Specification as defined by Philips.
