

# 150mA Low-Noise Low-Dropout Linear Regulator

## DESCRIPTION

The EUP7965 is designed for portable and wireless applications with demanding performance and space requirements.

The EUP7965 is stable with a small  $1\mu\text{F} \pm 30\%$  ceramic output capacitor. The EUP7965's performance is optimized for battery powered systems to deliver low noise, low dropout voltage, low quiescent current and excellent line and load transient response.

An optional external bypass capacitor reduces the output noise further without slowing down the load transient response. Power supply rejection is better than 65dB at low frequencies. High power supply rejection is maintained down to low input voltage levels common to battery operated circuits. Other features include a logic-controlled shutdown mode, short-circuit and thermal-shutdown protection. The EUP7965 is available in a SOT23-5, SOT23-6 package.

## FEATURES

- 2.5 to 5.5V Input Range
- 150mA Guaranteed Output
- 70dB PSRR at 1kHz @  $V_{IN}=V_{OUT}+1\text{V}$
- $50\mu\text{V}_{\text{rms}}$  Output Noise (typ) over 10Hz to 100kHz
- 100mV Maximum Dropout with 150mA Load
- Low  $85\mu\text{A}$  No-load Supply Current
- $\leq 1.5\mu\text{A}$  Shutdown Current
- Fast Start-up time.
- Stable with  $1\mu\text{F}$  Ceramic Capacitors
- Thermal Shutdown and Short-circuit Protection
- Preset Output Voltage 1.5V, 1.8V, 2.5V, 2.8V, 2.85V, 3.0V, 3.3V, 4.8V, 5.0V and adjustable
- SOT23-5, SOT23-6 package
- RoHS Compliant and 100% Lead (Pb)-Free

## APPLICATIONS

- Cellular and Cordless Handsets
- Bluetooth, Wireless LAN
- PDAs and Palmtop Computers
- Portable Information Appliances

## Pin Configurations

Part Number	Pin Configurations
EUP7965 SOT23-5	
EUP7965 SOT23-6	

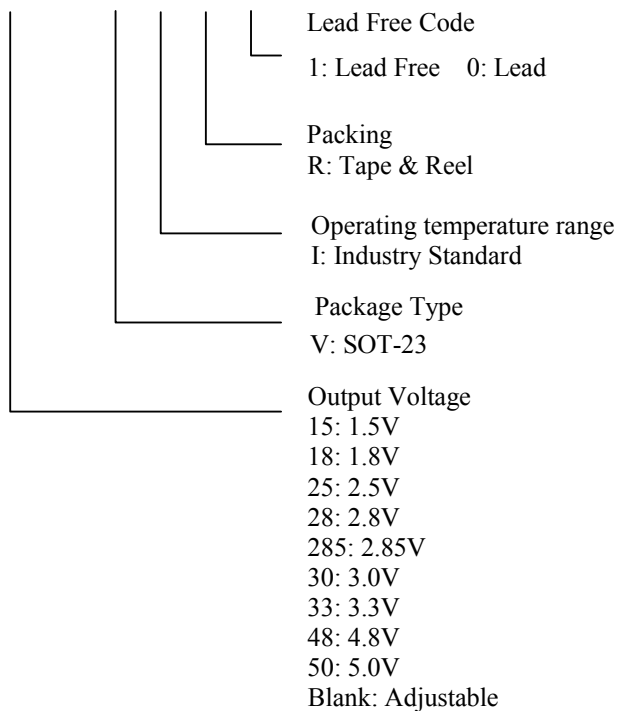

## Pin Description

PIN	SOT23-5	SOT23-6	DESCRIPTION
$V_{IN}$	1	1	Input voltage of the LDO
GND	2	2	Common ground
$V_{EN}$	3	3	Enable input logic, enable high
BYPASS	4	4	Optional bypass capacitor for noise reduction
SET		5	Output voltage set. Not externally connected for the fixed versions. Connect to resistor-divider for adjustable output voltage.
$V_{OUT}$	5	6	Output voltage of the LDO

## Ordering Information

Order Number	Package Type	Marking	Operating Temperature range
EUP7965-15VIR1	SOT23-5	G0	-40 °C to 85°C
EUP7965-18VIR1	SOT23-5	G1	-40 °C to 85°C

## Application Note

### External Capacitors

Like any low-dropout regulator, the EUP7965 requires external capacitors for regulator stability. The EUP7965 is specifically designed for portable applications requiring minimum board space and smallest components. These capacitors must be correctly selected for good performance.

### Input Capacitor

An input capacitance of  $\approx 1\mu\text{F}$  is required between the EUP7965 input pin and ground (the amount of the capacitance may be increased without limit).

This capacitor must be located a distance of not more than 1cm from the input pin and returned to a clean analog ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input.

If a tantalum capacitor is used at the input, it must be guaranteed by the manufacturer to have a surge current rating sufficient for the application.

There are no requirements for the ESR on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance will be  $\approx 1\mu\text{F}$  over the entire operating temperature range.

### Output Capacitor

The EUP7965 is designed specifically to work with very small ceramic output capacitors. A ceramic capacitor (temperature characteristics X7R, X5R, Z5U, or Y5V) in 1 to  $22\mu\text{F}$  range with  $5\text{m}\Omega$  to  $500\text{m}\Omega$  ESR range is suitable in the EUP7965 application circuit.

The output capacitor must meet the requirement for minimum amount of capacitance and also have an ESR (Equivalent Series Resistance) value which is within a stable range ( $5\text{m}\Omega$  to  $500\text{m}\Omega$ )

### No-Load Stability

The EUP7965 will remain stable and in regulation with no external load. This is specially important in CMOS RAM keep-alive applications.

### Capacitor Characteristics

The EUP7965 is designed to work with ceramic capacitors on the output to take advantage of the benefits they offer: for capacitance values in the range of  $1\mu\text{F}$  to  $4.7\mu\text{F}$  range, ceramic capacitors are the smallest, least expensive and have the lowest ESR values (which makes them best for eliminating high frequency noise). The ESR of a typical  $1\mu\text{F}$  ceramic capacitor is in the range of  $20\text{m}\Omega$  to  $40\text{m}\Omega$ , which easily meets the ESR requirement for stability by the EUP7965.

The ceramic capacitor's capacitance can vary with temperature. The capacitor type X7R, which operates over a temperature range of  $-55^\circ\text{C}$  to  $+125^\circ\text{C}$ , will only vary the capacitance to within  $\pm 15\%$ . Most large value ceramic capacitors ( $\approx 2.2\mu\text{F}$ ) are manufactured with Z5U or Y5V temperature characteristics. Their capacitance can drop by more than 50% as the temperature goes from  $25^\circ\text{C}$  to  $85^\circ\text{C}$ . Therefore, X7R is recommended over Z5U and Y5V in applications where the ambient temperature will change significantly above or below  $25^\circ\text{C}$ .

### Noise Bypass Capacitor

Connecting a  $0.01\mu\text{F}$  capacitor between the  $\text{C}_{\text{BYPASS}}$  pin and ground significantly reduces noise on the regulator output. This cap is connected directly to a high impedance node in the bandgap reference circuit. Any significant loading on this node will cause a change on the regulated output voltage. For this reason, DC leakage current through this pin must be kept as low as possible for best output voltage accuracy. The types of capacitors best suited for the noise bypass capacitor are ceramic and film.

Unlike many other LDO's, addition of a noise reduction capacitor does not effect the load transient response of the device.

### On/Off Input Operation

The EUP7965 is turned off by pulling the  $\text{V}_{\text{EN}}$  pin low, and turned on by pulling it high. If this feature is not used, the  $\text{V}_{\text{EN}}$  pin should be tied to  $\text{V}_{\text{IN}}$  to keep the regulator output on at all time. To assure proper operation, the signal source used to drive the  $\text{V}_{\text{EN}}$  input must be able to swing above and below the specified turn-on/off voltage thresholds listed in the Electrical Characteristics section under  $\text{V}_{\text{IL}}$  and  $\text{V}_{\text{IH}}$ .

### Fast Start up

The EUP7965 output starts up after  $\text{V}_{\text{ref}}$  voltage reaches its final value ( $1.23\text{V}$  nominal). The start-up time is determined by the time constant of the bypass capacitor. The smaller the capacitor value., the shorter the start-up time, but less noise gets reduced. As a result, start-up time and noise reduction need to be taken into design consideration when choosing the value of the bypass capacitor.

**Adjustable Operation**

The adjustable version of the EUP7965 has an output voltage range of 1.25V to 5V. The output voltage of the EUP7965 adjustable regulator is programmed using an external resistor divider as shown in Figure3. The output voltage is calculated using:

$$V_O = V_{\text{ref}} \times \left(1 + \frac{R_1}{R_2}\right)$$

Where:

$V_{\text{ref}}=1.23\text{V}$  typ. (the internal reference voltage)

Utilize the following equation for adjusting the output to a particular voltage:

$$R_1 = R_2 \left[ \frac{V_O}{1.23\text{V}} - 1 \right]$$

Choose  $R_2=100\text{k}$  to optimize accuracy, power supply rejection, noise and power consumption.

In order to improve the stability of the adjustable version, it is suggested that a small compensation capacitor  $C_1$  be placed between  $V_{\text{OUT}}$  and SET .

## Packaging Information

## SOT23-5

**Note:**

1. Package body sizes exclude mold flash protrusions or gate burrs.
2. Tolerance  $\pm 0.1000\text{mm}$  (4 mil) unless otherwise specified.
3. Coplanarity:  $0.1000\text{mm}$
4. Dimension L is measured in gage plane.
