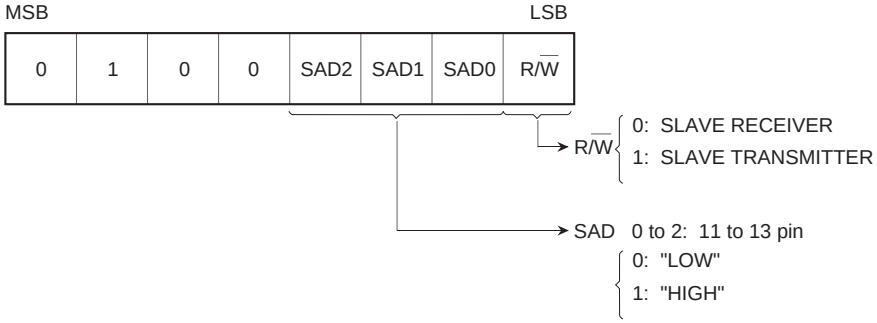
Definition of I²C Register

<Slave address>



<Register table>

- With the IC reset all registers are reset to 0
- ∗: Not defined
- ×: Don't care
- Sub address is auto incremented
- It can be used as a 6-bit D/A converter by setting the lower two bits of DAC 0-4 registors to 0, but take care that the max. voltage of DA output will lower about 100 mV compared with the use of 8 bits.

PONRES (1): Detects POWER ON RESET
0:Master passes from the bus and is reset to 0 after having read this status
1:Set to 1 when power supply is turned on or when there has been a power dip

ST0 to 3 (1): Detects and registers the voltage condition of Pins 1, 2, 9 and 10
0:1.5 V and below
1:3.0 V and above

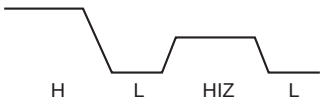
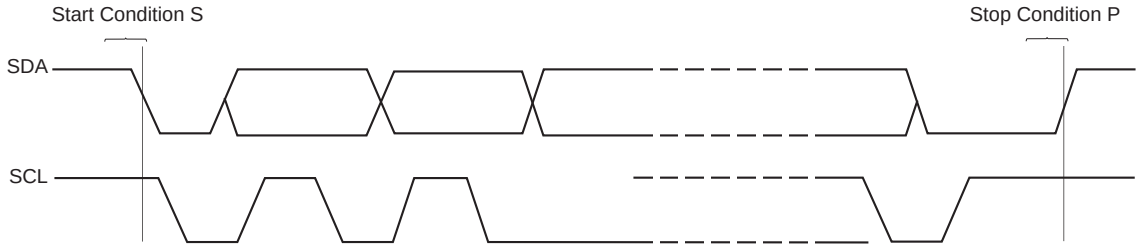
I²C Bus Signal

There are 2 signals in I²C bus. SDA (Serial DAta) and SCL (Serial Clock).
SDA is double-way.

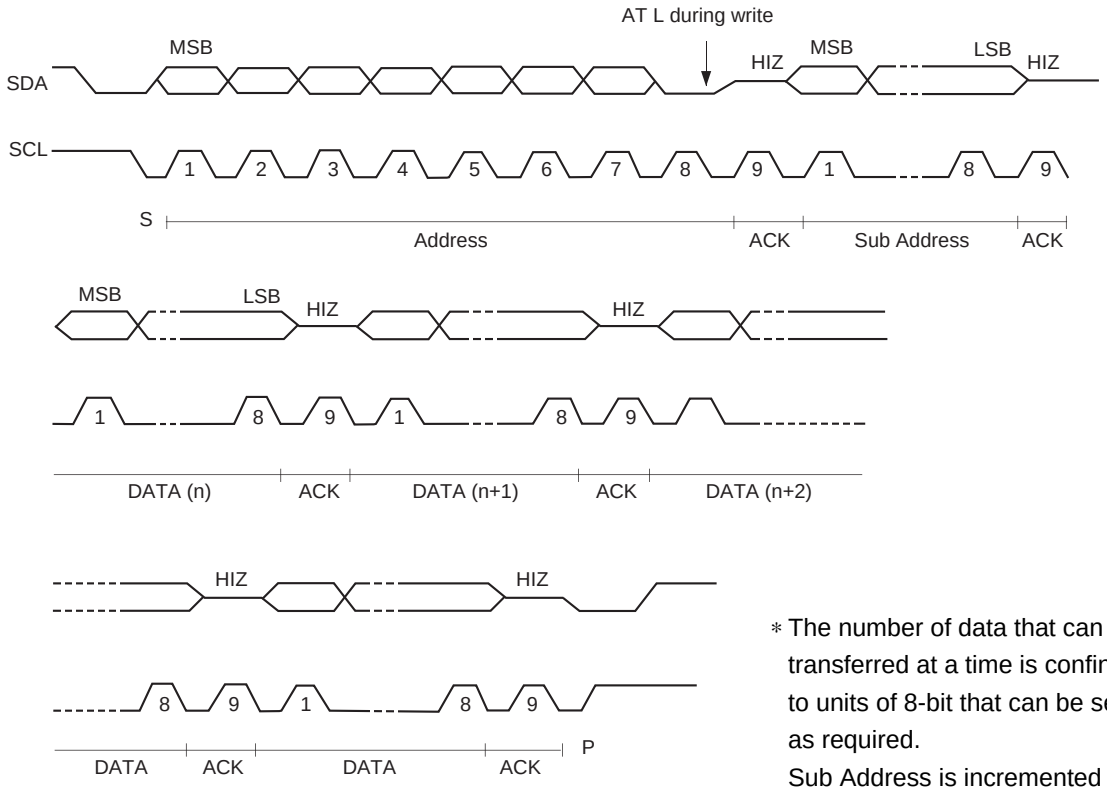
• As SDA is double-way it has 3 state outputs, H, L and HIZ.



• I²C transfer begins with Start Condition and ends with Stop Condition.

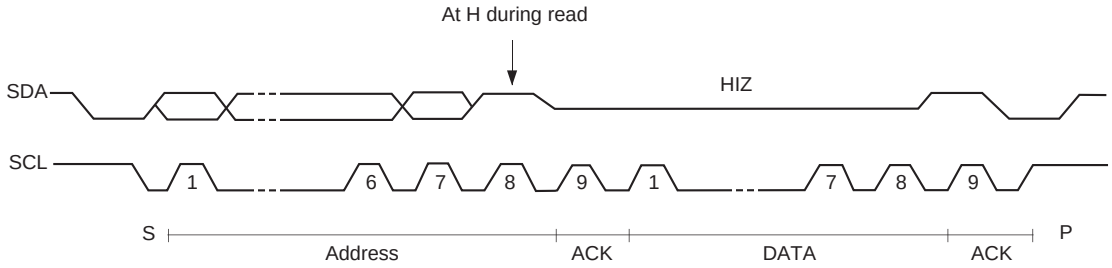


• I²C data write (Write from I²C controller to IC)

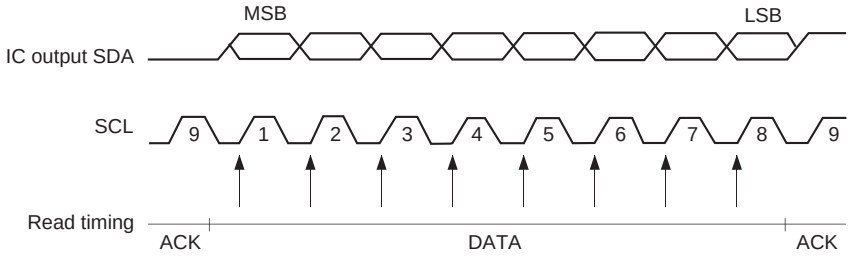


∗ The number of data that can be transferred at a time is confined to units of 8-bit that can be set as required.
Sub Address is incremented automatically.

• I²C data read (Read from IC to I²C controller)



• Read timing



∗ Data read is performed with SCL rise.
