- Tolerable back reflection is the max back reflection level at which the power penalty will be <1dB.
- Dispersion power penalty is measured in loop back with OSNR set to 28 dB. Data rate and pattern used same as specified for Optical Input Power. Dispersion power penalty is the difference in Rx power at a BER of 10⁻¹² for 0ps/nm and 3200ps/nm.
- Dispersion noise penalty is measured in loop back with Rx power set between -9dBm and -22dBm. Data rate and pattern used same as specified for Optical Input Power. Dispersion noise penalty is the difference in OSNR at a BER of 10⁻¹² for 0ps/nm and 3200ps/nm

VI. Wavelength Stabilization

The laser transmitter will not be turned on until its temperature is adjusted to ensure operation within the specified channel ($X \pm 300\text{pm}$). This temperature stabilization time is dependent on the ambient temperature conditions, but will typically occur within 5 seconds of powering the device. The module will transmit within the specified wavelength tolerance ($X \pm 100\text{pm}$) within 10 ms of transmitter operation.

IX. Serial Communication Protocol

All Finisar SFPs support the 2-wire serial communication protocol to provide module ID information as outlined in the SFP MSA¹. These SFPs use an Atmel AT24C01A 128 byte E²PROM with an address of A0h. For details on interfacing with the E²PROM, see the Atmel data sheet titled “AT24C01A/02/04/08/16 2-Wire Serial CMOS E²PROM.”³

Finisar SFPs also support diagnostic features as described in Finisar Applications Note AN-2030⁴ and SFF-8472⁵, “Digital Diagnostic Monitoring Interface for Optical Transceivers”. A controller IC that monitors system parameters such as laser current, module temperature, transmitter power, and received power is accessible at address A2H. In addition, Finisar’s DWDM SFPs provide extended set of ID information and diagnostic features as described in the DWDM SFP MSA⁶.
