

3-MODE 200mA LDO REGULATOR

NO.EA-083-0607

OUTLINE

The R1160x Series consist of CMOS-based voltage regulator ICs with high output voltage accuracy, low supply current, and low ON-resistance. Each of these voltage regulator ICs consists of a voltage reference unit, an error amplifier, resistors for setting Output Voltage, a current limit circuit, and a chip enable circuit.

These ICs perform with low dropout voltage and a chip enable function. To prevent the destruction by over current, current limit circuit is included. The R1160x Series have 3-mode. One is standby mode with CE or standby control pin. Other two modes are realized with ECO pin™. Fast Transient Mode (FT mode) and Low Power Mode (LP mode) are alternative with ECO pin™. Consumption current is reduced to 1/10 at Low Power Mode compared with Fast Transient Mode. Output voltage is maintained between FT mode and LP mode.

The output voltage of these ICs is internally fixed with high accuracy. Since the packages for these ICs are SOT-23-5 and SON-6 packages, high density mounting of the ICs on boards is possible.

FEATURES

- Ultra-Low Supply Current.....Typ. 3.5 μ A (Low Power Mode, $V_{OUT} \leq 1.5V$)
Typ. 40 μ A (Fast Transient Mode)
- Standby ModeTyp. 0.1 μ A
- Low Dropout Voltage.....Typ. 0.30V ($I_{OUT}=200mA$ 3.0V Output Voltage=1.0V Type)
Typ. 0.20V ($I_{OUT}=200mA$ 3.0V Output Voltage=1.5V Type)
Typ. 0.14V ($I_{OUT}=200mA$ 3.0V Output Voltage=3.0V Type)
- High Ripple RejectionTyp. 70dB ($f=1kHz$, FT Mode)
- Low Temperature-Drift Coefficient of Output Voltage Typ. $\pm 100ppm/^{\circ}C$
- Excellent Line RegulationTyp. 0.05%/V
- High Output Voltage Accuracy $\pm 2.0%$ ($\pm 3.0%$ at LP Mode)
- Output Voltage0.8V to 3.3V
- Input VoltageMin.1.4V
- Built-in Fold Back Protection CircuitTyp. 50mA (Current at short mode)
- Small PackagesSOT-23-5 (Super Mini-mold),SON-6

APPLICATIONS

- Precision Voltage References.
- Power source for electrical appliances such as cameras, VCRs and hand-held communication equipment.
- Power source for battery-powered equipment.

TECHNICAL NOTES

(External Components)

C1: Ceramic Capacitor 1 μ F

C2: Tantalum Capacitor 2.2 μ F

When using these ICs, consider the following points:

1. Mounting on PCB

Make V_{DD} and GND lines sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect a capacitor with a capacitance value as much as 1.0 μ F or more as C_1 between V_{DD} and GND pin, and as close as possible to the pins.

Set external components, especially the output capacitor, as close as possible to the ICs, and make wiring as short as possible.

2. Phase Compensation

In these ICs, phase compensation is made for securing stable operation even if the output current is varied. For this purpose, be sure to use a 2.2 μ F or more capacitor C_{OUT} with good frequency characteristics and ESR (Equivalent Series Resistance).

(Note: When the additional ceramic capacitors are connected to the Output Pin with Output capacitor for phase compensation, the operation might be unstable. Because of this, test these ICs with as same external components as ones to be used on the PCB.)

If you use a tantalum type capacitor and ESR value of the capacitor is large, output might be unstable. Evaluate your circuit with considering frequency characteristics.

Depending on the capacitor size, manufacturer, and part number, the bias characteristics and temperature characteristics are different. Evaluate the circuit with actual using capacitors.

ESR vs. Output Current

When using these ICs, consider the following points:

In these ICs, phase compensation is made for securing stable operation even if the Output Current is varied. For this purpose, be sure to use a capacitor C_{OUT} with good frequency characteristics and ESR (Equivalent Series Resistance) in the range described as follows:

The relations between I_{OUT} (Output Current) and ESR of Output Capacitor are shown below. The conditions when the white noise level is under $40\mu V$ (Avg.) are marked as the hatched area in the graph.
