

5 BIT – D/A CONVERTER AND POSITION AMPLIFIER

- 5 BIT D/A CONVERTER (1/2 LSB MAX LINEARITY ERROR) ;
- ERROR AMPLIFIER ;
- POSITION AMPLIFIER.

DESCRIPTION

The L291, a monolithic LSI circuit in a 16-lead dual in-line plastic package, is intended for use with the L290 and L292 to form a complete 3 chip DC motor positioning system for applications such as carriage/daisy-wheel position control in typewriters.

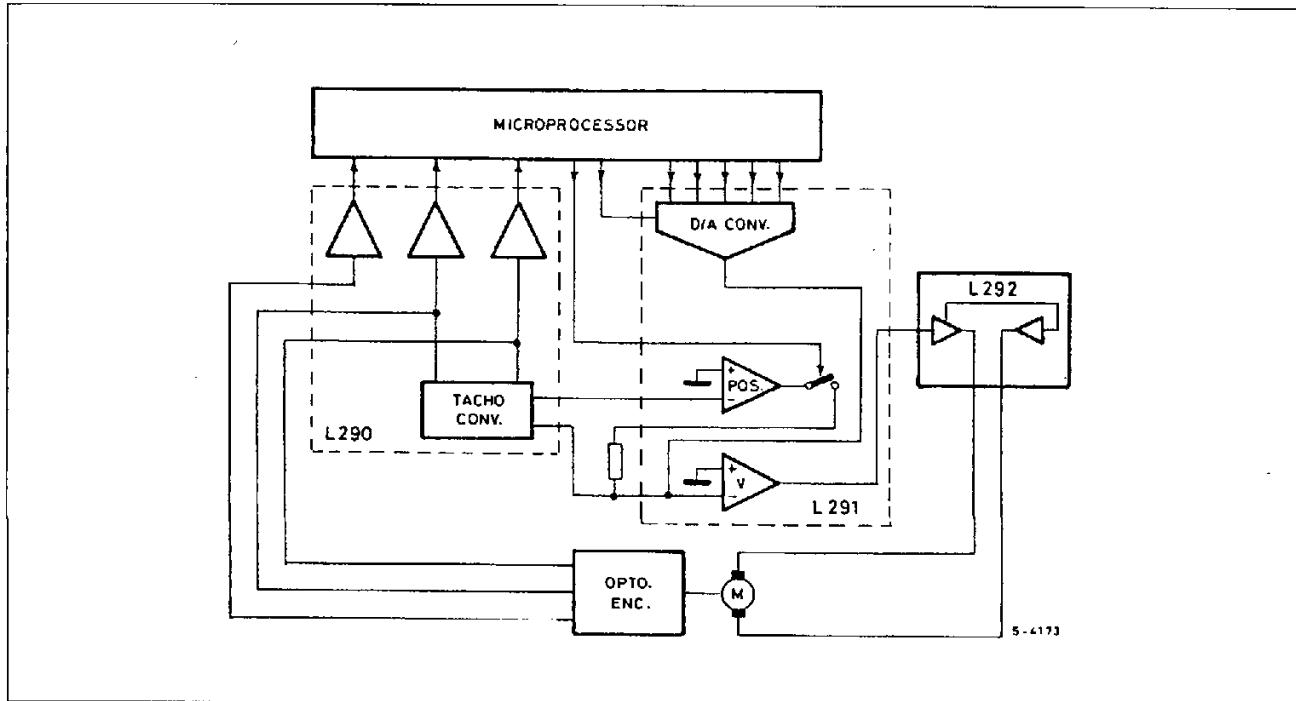

The L290/291/292 system can be directly controlled by a microprocessor.

D/A CONVERTER

The L291 contains a 5-bit D/A converter accepting a binary code and generating a bipolar output current, the polarity of which depends on the SIGN input. The amplitude of the output current is a multiple of a reference current I_{ref} .

The maximum output current is

$$I_{FS} = \pm \frac{31}{16} I_{ref}$$

The following table shows the value of I_o for different input codes. Note that the input bits are active low.

DIGITAL INPUT WORD						Output Current I_o
SIGN	SC5 MSB	SC4	SC3	SC2	SC1 LSB	
L	L	L	L	L	L	$-\frac{31}{16} I_{ref}$
L	H	H	H	H	L	$-\frac{1}{16} I_{ref}$
X	H	H	H	H	H	0
H	H	H	H	H	L	$+\frac{1}{16} I_{ref}$
H	L	L	L	L	L	$+\frac{31}{16} I_{ref}$

X = indifferent

L = low

H = high

This D/A converter has a maximum linearity error equal to $\pm 1/2$ LSB (or $\pm 1.61\%$ Full Scale) ; that guarantees its monotonicity.

ERROR AMPLIFIER

In order to have a good stability, the Error Amplifier must work with a closed loop gain greater or equal than 20 dB.

POSITION AMPLIFIER

It is inserted by means of the strobe signal, TTL and microprocessor compatible. Its output is connected to pin 16 when $V_{strobe} = \text{Low}$; pin 16 is grounded for $V_{strobe} = \text{High}$.
