

FEATURES

- Gain Bandwidth Product, $A_V = +1$ 90MHz
- Slew Rate 450V/ μ s
- Low Cost
- Output Current ± 50 mA
- Settling Time 110ns to 0.1%
- Differential Gain Error 0.07%, ($R_L = 1k$)
- Differential Phase Error 0.02°, ($R_L = 1k$)
- High Open Loop Gain 25V/mV Min
- Single Supply +5V Operation
- Output Shutdown

APPLICATIONS

- Video Cable Drivers
- Video Signal Processing
- Fast Integrators
- Pulse Amplifiers
- D/A Current to Voltage Conversion

DESCRIPTION

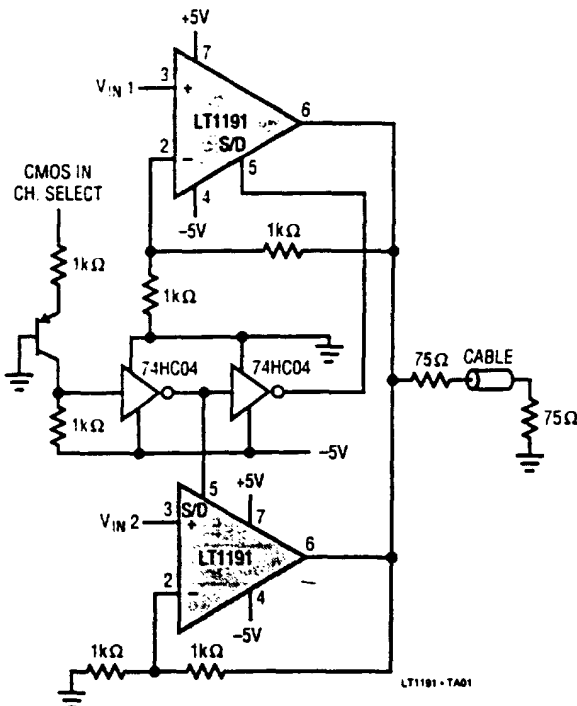

The LT1191 is a video operational amplifier optimized for operation on ± 5 V, and a single +5V supply. Unlike many high speed amplifiers, this amplifier features high open loop gain, over 90dB, and the ability to drive heavy loads to a full power bandwidth of 20MHz at 7Vp-p. In addition to its very fast slew rate, the LT1191 features a unity gain stable bandwidth of 90MHz.

Because the LT1191 is a true operational amplifier, it is an ideal choice for wideband signal conditioning, fast integrators, active filters, and applications requiring speed, accuracy, and low cost.

The LT1191 is available in 8-pin miniDIPs and SO packages with standard pinouts. The normally unused pin 5 is used for a shutdown feature that shuts off the output and reduces power dissipation to a mere 15mW.

The ● denotes the specifications which apply over the full operating temperature range.

Note 1: A heat sink is required to keep the junction temperature below absolute maximum when the output is shorted.

Note 2: Exceeding the input common mode range may cause the output to invert.

Note 3: Slew rate is measured between $\pm 1V$ on the output, with a $\pm 1.5V$ input step.

Note 4: Full power bandwidth is calculated from the slew rate measurement: $FPBW = SR/2\pi V_p$.

Note 5: Settling time measurement techniques are shown in "Take the Guesswork Out of Settling Time Measurements," EDN, September 19, 1985. $A_V = -1, R_L = 1k$.

Note 6: NTSC (3.58MHz). For $R_L = 1k$, Diff $A_V = 0.07\%$, Diff Ph = 0.02° .

Note 7: See Applications section for shutdown at elevated temperatures. Do not operate the shutdown above $T_J > 125^\circ C$.

Note 8: AC parameters are 100% tested on the ceramic and plastic DIP packaged parts (J and N suffix) and are sample tested on every lot of the SO packaged parts (S suffix).

Optional Offset Nulling Circuit

INPUT OFFSET VOLTAGE CAN BE ADJUSTED OVER A $\pm 100mV$ RANGE WITH A $1k\Omega$ TO $10k\Omega$ POTENTIOMETER.

APPLICATIONS INFORMATION

Power Supply Bypassing

The LT1191 is quite tolerant of power supply bypassing. In some applications a 0.1 μ F ceramic disc capacitor placed 1/2 inch from the amplifier is all that is required. A scope photo of the amplifier output with no supply bypassing is used to demonstrate this bypassing tolerance, $R_L = 1k\Omega$.

No Supply Bypass Capacitors

$A_V = -1$, IN DEMO BOARD, $R_L = 1k\Omega$

LT1191 - TA04

Supply bypassing can also affect the response in the frequency domain. It is possible to see a slight rise in the frequency response at 130MHz depending on the gain configuration, supply bypass, inductance in the supply leads, and printed circuit board layout. This can be further minimized by not using a socket.

Closed Loop Voltage Gain vs Frequency

LT1191 - TA05

In most applications, and those requiring good settling time, it is important to use multiple bypass capacitors. A 0.1 μ F ceramic disc in parallel with a 4.7 μ F tantalum is recommended. Two oscilloscope photos with different bypass conditions are used to illustrate the settling time characteristics of the amplifier. Note that although the output waveform looks acceptable at 1V/div, when amplified to 1mV/div the settling time to 2mV is 2.61 μ s for the 0.1 μ F bypass; the time drops to 143ns with multiple bypass capacitors.

Settling Time Poor Bypass

SETTLING TIME TO 2mV, $A_V = -1$
SUPPLY BYPASS CAPACITORS = 0.1 μ F

SUPPLY BYPASS CAPACITORS = 0.1 μ F + 4.7 μ F TANTALUM

LT1191 - TA07

APPLICATIONS INFORMATION

Cable Terminations

The LT1191 operational amplifier has been optimized as a low cost video cable driver. The $\pm 50\text{mA}$ guaranteed output current enables the LT1191 to easily deliver 7.5Vp-p into 100Ω , while operating on $\pm 5\text{V}$ supplies, or 2.6Vp-p on a single 5V supply.

When driving a cable it is important to terminate the cable to avoid unwanted reflections. This can be done in one of two ways: single termination or double termination. With single termination, the cable must be terminated at the receiving end (75Ω to ground) to absorb unwanted energy. The best performance can be obtained by double termination (75Ω in series with the output of the amplifier, and 75Ω to ground at the other end of the cable). This termination is preferred because reflected energy is absorbed at each end of the cable. When using the double termination technique it is important to note that the signal is attenuated by a factor of 2, or 6dB . This can be compensated for by taking a gain of 2, or 6dB in the amplifier. The cable driver has a -3dB bandwidth of 100MHz while driving the 150Ω load. Note the response can be improved by lowering the impedance of the feedback elements.

Double Terminated Cable Driver

Cable Driver Voltage Gain vs Frequency

LT1191 - TA06

Using the Shutdown Feature

The LT1191 has a unique feature that allows the amplifier to be shutdown for conserving power, or for multiplexing several amplifiers onto a common cable. The amplifier will shutdown by taking pin 5 to V^- . In shutdown, the amplifier dissipates 15mW while maintaining a true high impedance output state of $15\text{k}\Omega$ in parallel with the feedback resistors. The amplifiers must be used in a non-inverting configuration for MUX applications. In inverting configurations the input signal is fed to the output through the feedback components. The following scope photos show that with very high R_L , the output is truly high impedance; the output slowly decays toward ground. Additionally, when the output is loaded with as little as $1\text{k}\Omega$ the amplifier shuts off in 400ns . This shutoff can be under the control of HC CMOS operating between 0V and -5V .

Output Shutdown

1MHz SINE WAVE GATED OFF WITH SHUTDOWN PIN, $A_V = +1$, $R_L = \infty$

LT1191 - TA00

Output Shutdown

1MHz SINE WAVE GATED OFF WITH SHUTDOWN PIN, $A_V = +1$, $R_L = 1\text{k}\Omega$

LT1191 - TA10

APPLICATIONS INFORMATION

The ability to maintain shutoff is shown on the curve Shutdown Supply Current vs Temperature in the Typical Performance Characteristics section. At very high elevated temperatures it is important to hold the shutdown pin close to the negative supply to keep the supply current from increasing.

Murphy Circuits

There are several precautions the user should take when using the LT1191 in order to realize its full capability. Although the LT1191 can drive a 30pF load, isolating the capacitance with 10Ω can be helpful. Precautions primarily have to do with driving large capacitive loads.

Other precautions include:

1. Use a ground plane (see Design Note 50, High Frequency Amplifier Evaluation Board).
2. Do not use high source impedances. The input capacitance of 2pF, and $R_S = 10k\Omega$ for instance, will give an 8MHz -3dB bandwidth.
3. PC board socket may reduce stability.
4. A feedback resistor of 1kΩ or lower reduces the effects of stray capacitance at the inverting input. (For instance, closed loop gain of +2 can use $R_{FB} = 300\Omega$ and $R_G = 300\Omega$.)
