

FEATURES

- 35 nSec maximum acquisition time to 0.01%
- 30 nSec maximum hold-mode settling to 0.01%
- 1 pSec aperture uncertainty
- 150 MHz small-signal bandwidth
- 545 mW power dissipation
- Small 14-pin DIP package
- CMOS control signal

PRODUCT OVERVIEW

The SHM-43 sample-hold utilizes a proprietary architecture in delivering an acquisition time of 35 nanoseconds maximum to 0.01% and 20 nanoseconds maximum to 0.1% accuracy.

Operation requires +15V and ±5V supplies and the analog input range is ±2V. Packaged in a small 14-pin DIP, the SHM-43 offers a CMOS compatible sample command while dissipating just 545 milliwatts.

The SHM-43 has been designed for applications that demand fast acquisition times (25 nS,

±0.01%), fast hold mode settling (20nS, ±0.01%), wide bandwidth, and the ability to drive resistive (100Ω), and capacitive (50 pF) loads with no compromise in performance. These features make the SHM-43 an ideal choice for driving flash A/D converters in applications such as radar and communications.

Two temperature ranges are offered: the commercial 0 to +70 °C and military -55 to +125 °C.

Figure 1. Simplified Block Diagram

ORDERING GUIDE SUMMARY

Model Number	Temperature Range
SHM-43MC	0 to +70 °C
SHM-43MM	-55 to +125 °C

Package Type	14-Pin metal DIP			

① Murata Power Solutions (DATEL) uses the conservative definition of Acquisition time, which includes the Aperture Delay time.

Absolute Maximum Ratings

PARAMETERS	LIMITS	UNITS
+15V supply (pin 12)	-0.5 to +18	Vdc
+5V supply (pin 4, 14)	-0.5 to +7	Vdc
-5V supply (pin 13)	+0.5 to -7	Vdc
Analog input (pin 1)	+5V Supply +1 -5V Supply -1	Vdc Vdc
Digital inputs (pins 5, 6)	-0.5 to +7	Vdc
Lead temperature (10 sec.)	300	°C
Short circuit to ground	70	mA
Output shorted to any supply will cause permanent damage.		

TECHNICAL NOTES

- Bypass the ±5V analog, +5V digital, +15V supplies with a 1µF, 25V tantalum capacitor in parallel with a 0.01 µF ceramic capacitor mounted as close to the pin as possible.
To achieve optimum performance-
- Additional bypass capacitors are necessary, because of internal high switching speeds, and high slew rates of internal components. REF BYPASS (pin 2), +5 BYPASS (pin 9), and -5 BYPASS (pin 10) are internal connections that must be bypassed with a minimum 1µF tantalum capacitor mounted as close to the pin as possible. The polarity of the connections are shown on the test circuit drawing, Figure 2.
- As with all high speed analog circuits, it is essential that good grounding techniques be used. Tie all ground pins together at a single ground point beneath the device, and use a short low impedance run to the ground of the analog power supplies. The ground point should be a solid ground plane under the device and any associated data converter.
- The offset, pedestal, and gain errors of the SHM-43 are laser trimmed at Murata Power Solutions (DATEL) and no external compensation capabilities have been provided. This prevents introducing noise through the offset adjust terminals of the S/H amplifier and guarantees excellent gain linearity, offset drift, and pedestal performance.

Figure 2. Test Circuit Connections

* Connections shown for $\overline{S/H}$; if opposite polarity sample hold command is desired, connect S/H CONTROL (pin 6) to DIGITAL +5V (pin 4). Using the opposite polarity S/H command will not effect speed or accuracy.

** The SHM-43 MS been optimized for driving 100Ω loads. R1 should be chosen so that the total load on the S/H is 100Ω.
