Issue 2, 20 October 2005

RX2A

UHF FM receiver module with RSSI

The RX2A is a miniature PCB mounting UHF radio data receiver. It is an updated version of the Radiometrix RX2 incorporating a received signal strength indicator (RSSI). It allows the simple implementation of data links at speeds up to 64kb/s and distances up to 75 metres in-building or 300 metres over open ground.

Figure 1: RX2A-433-10 and TX2-433-40

Features

- ◆ Designed to comply with harmonised radio standard EN 300 220-3
- ◆ Designed to comply with harmonised EMC standard EN 301 489-3
- ◆ Data rates up to 64kb/s
- ◆ Usable range up to 300m
- ◆ Versions available on 433.92MHz and 434.42MHz
- ◆ Fully screened

Available for operation at 433.92MHz or 434.42MHz in the UK and Europe, the RX2A combines full screening with internal filtering to ensure EMC compliance by minimising spurious radiation and susceptibility. The module suits one-to-one and multi-node wireless links in applications including car and building security, EPOS and inventory tracking, remote industrial process monitoring and computer networking. Because of the small size and low power requirements, the RX2A is ideal for use in portable, battery-powered applications such as hand-held terminals.

Technical Summary

- ◆ Single conversion FM superhet
- ◆ SAW front end filter gives >50dB image rejection
- ◆ Operation from 2.7V to 16V @ 12mA
- ◆ Built-in regulator for improved stability and supply noise rejection
- ◆ -101dBm sensitivity @ 1ppm BER, 64kb/s version
- ◆ -108dBm sensitivity @ 1ppm BER, 10kb/s version
- ◆ RSSI output with 60dB range
- ◆ Extremely low LO leakage, <-100dBm

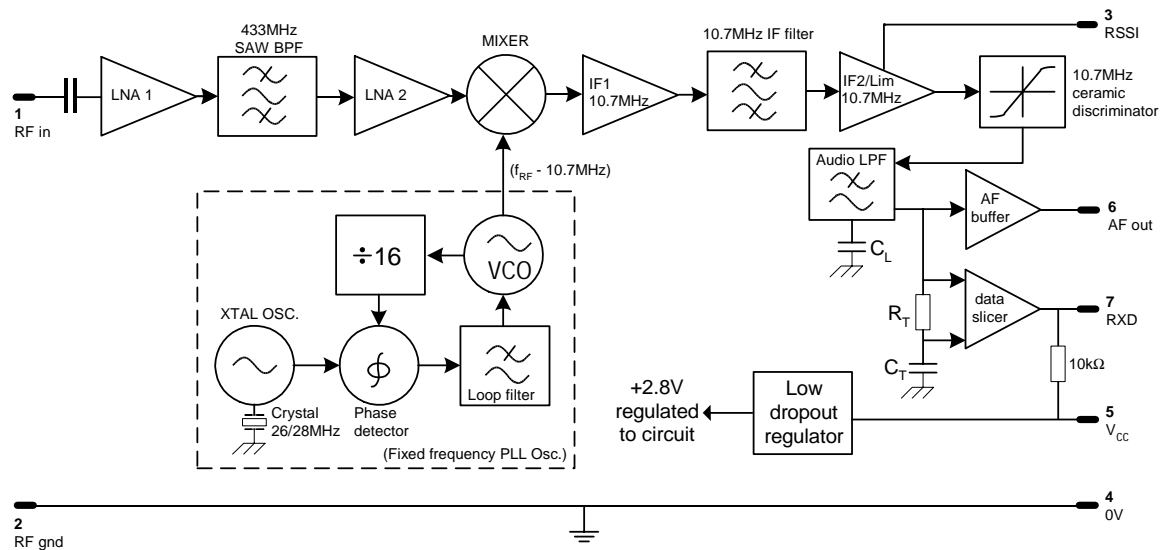

Figure 2: RX2A Block diagram

Pin description

RF IN (pin 1)
50Ω input from the antenna, DC isolated

RF GND (pin 2)
RF ground pin, internally connected to the module screen and pin 4 (0V). This pin should be connected to the RF return path (coax braid, main PCB ground plane etc.)

Figure 3: Physical dimensions

RSSI (pin 3)
Received signal strength indicator with 60dB range. See page 4 for typical characteristics.

0V (pin 4)
DC supply ground. Internally connected to pin 2 and module screen.

Vcc (pin 5)
+2.7V to +16.0V DC supply. Max ripple content 0.1V_{p-p}. Decoupling is not generally required.

AF out (pin 6)
Buffered and filtered analogue output from the FM demodulator. Standing DC bias 1.1V approx. External load should be >10k // <100pF.

RXD (pin 7)
Digital output from the internal data slicer. The data is a squared version of the signal on pin 6 (AF) and is true data, i.e. as fed to the transmitter. Output is “open-collector” format with internal 10k pull-up to Vcc (pin 5).

Absolute maximum ratings

Exceeding the values given below may cause permanent damage to the module.

Operating temperature-	-20°C to +70°C
Storage temperature	-40°C to +100°C
Vcc (pin 5)	-0.1V to +16V
RSSI, AF, RXD (pins 3,6,7)	-0.1V to +3V
RF IN (pin 1)	±8V DC, +10dBm RF

Performance specifications: RX2A

(Vcc = 5.0V / temperature = 20°C unless stated)

	pin	min.	typ.	max	units	notes
DC supply						
Supply voltage	5	2.7	5.0	16.0	V	
Supply current	5	11	11.6	13	mA	1
RF/IF						
RF sensitivity for 10dB (S+N/N)	1,6	-	-115	-	dBm	10kb/s version
RF sensitivity for 10dB (S+N/N)	1,6	-	-108	-	dBm	64kb/s version
RF sensitivity for 1ppm BER	1,7	-	-108	-	dBm	10kb/s version
RF sensitivity for 1ppm BER	1,7	-	-101	-	dBm	64kb/s version
RSSI range	1,3	-	60	-	dB

Power up with signal present						
Power up to valid RSSI	3,5	-	1	-	ms	
Power up to stable data	5,7	-	10	30	ms	3, 10kb/s version
Power up to stable data	5,7	-	5	10	ms	3, 64kb/s version
Signal applied with supply on						
RSSI response time (rise/fall)	1,3	-	100	-	µs	
Signal to stable data	1,7	-	5	30	ms	3, 10kb/s version
Signal to stable data	1,7	-	5	10	ms	3, 64kb/s version
Time between data transitions	7	0.1	-	15	ms	4, 10kb/s version
Time between data transitions	7	15.6	-	1500	µs	4, 64kb/s version
Mark:space ratio	7	20	50	80	%	5

- Notes:**
1. Current increases at higher RF input levels (>-20dBm and above)
 2. For received signal with ±40kHz FM deviation.
 3. Typical figures are for signal at centre frequency, max. figures are for ±50kHz offset.
 4. For 50:50 mark to space ratio (i.e. square wave).
 5. Average over 30ms (10kb/s version) or 3ms (64kb/s version) at maximum data rate.

Power supply requirements

The RX2A incorporates a built-in regulator which delivers a constant 2.8V to the module circuitry when the external supply voltage is 2.85V or greater, with 40dB or more of supply ripple rejection. This ensures constant performance up to the maximum permitted supply rail and removes the need for external supply decoupling except in cases where the supply rail is extremely poor (ripple/noise content $>0.1V_{p-p}$).

Note, however, that for supply voltages lower than 2.85V the regulator is effectively inoperative and supply ripple rejection is considerably reduced. Under these conditions the ripple/noise on the supply rail should be below $10mV_{p-p}$ to avoid problems. If the quality of the supply is in doubt, it is recommended that a $10\mu F$ low-ESR tantalum or similar capacitor be added between the module supply pin (Vcc) and ground, together with a 10Ω series feed resistor between the Vcc pin and the supply rail.

Received Signal Strength Indicator (RSSI)

The module incorporates a wide range RSSI which measures the strength of an incoming signal over a range of approximately 60dB. This allows assessment of link quality and available margin and is useful when performing range tests.

Please note that the actual RSSI voltage at any given RF input level varies somewhat between units. The RSSI facility is intended as a relative indicator only - it is not designed to be, or suitable as, an accurate and repeatable measure of absolute signal level or transmitter-receiver distance.

The output on pin 3 of the module has a standing DC bias of 0.15V-0.45V (0.25V typ.) with no signal, rising to 0.9-1.3V (1.15V typ.) at maximum indication. The RSSI output source impedance is high ($\sim 50k\Omega$) and external loading should therefore be kept to a minimum.

To ensure a fast response the RSSI has limited internal decoupling of 1nF to ground. This may result in a small amount of ripple on the DC output at pin 3 of the module. If this is a problem further decoupling may be added at the expense of response speed, in the form of a capacitor from pin 3 to ground. For example, adding 10nF here will increase RSSI response time from $100\mu s$ to around 1ms. The value of this capacitor may be increased without limit.

Typical RSSI characteristic is shown below (this is for indicative purposes only and is not a guarantee of actual RSSI characteristics):

Figure 4: Typical RSSI response

Module mounting considerations

The module may be mounted vertically or bent horizontal to the motherboard. Good RF layout practice should be observed – in particular, any ground return required by the antenna or feed should be connected directly to the RF GND pin at the antenna end of the module, and not to the OV pin which is intended as a DC ground only. All connecting tracks should be kept as short as possible to avoid any problems with stray RF pickup.

If the connection between module and antenna does not form part of the antenna itself, it should be made using 50Ω microstrip line or coax or a combination of both. It is desirable (but not essential) to fill all unused PCB area around the module with ground plane.

The module may be potted if required in a viscous compound which cannot enter the screen can.

Warning: *DO NOT wash the module. It is not hermetically sealed.*

Figure 5: Module mounting options

Variants and ordering information

The RX2A receiver is manufactured in several variants:

<i>Data rate:</i>	Slower version: (suffix -10)	7.8kHz baseband B/W,	data rate up to 10kb/s
	Faster version: (suffix -64)	50kHz baseband B/W,	data rate up to 64kb/s
<i>Frequency:</i>	433.92MHz (suffix -433)		
	434.42MHz (suffix -434)		

The following variants are standard:

RX2A-433-10	433.92MHz, 10kbps
RX2A-433-64	433.92MHz, 64kbps

For other variants please contact Sales department.
