## GENERAL DESCRIPTION

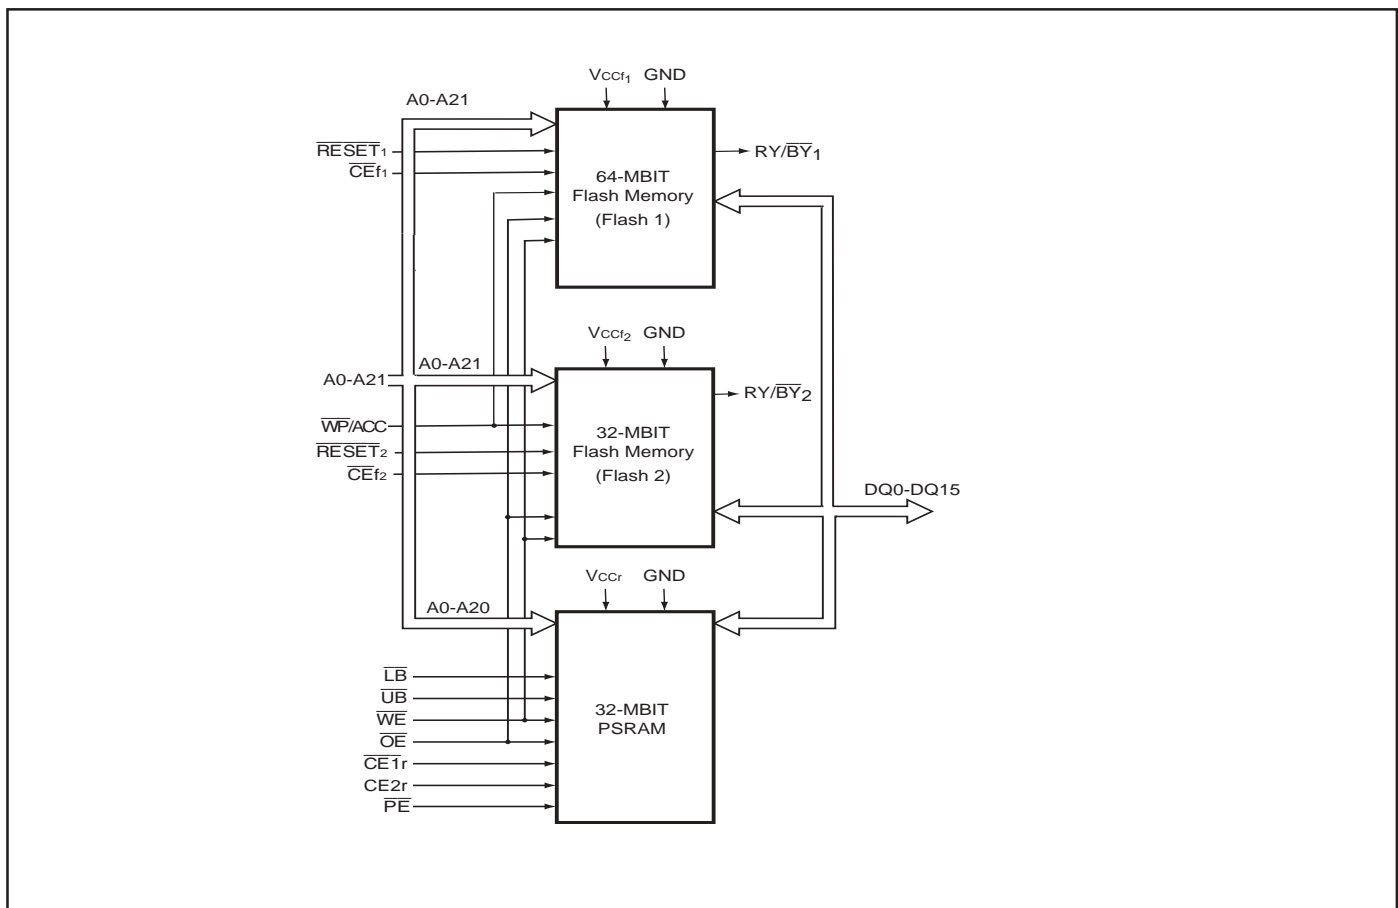

This 107-ball MCP is a space-saving combination of 3 memories: two 64Mbit Flash and one 32Mbit Pseudo SRAM. Each 64Mbit Flash (Flash1 and Flash 2) contains 4,194,304 words and the 32Mbit PSRAM contains 2,097,152 words. Each word is 16 bits wide. Data lines DQ0-DQ15 handle the access for all three memories. Write Enable, Output Enable, and A0-A20 are shared among the three memories. Single Byte data on the PSRAM can be accessed one at a time on DQ0-DQ7 or DQ8-DQ15 by using  $\overline{LB}$  or  $\overline{UB}$ , respectively.

The package uses a 3.0V power supply for all operations. No other source is required for program and erase operations. The flash can be programmed in system using this 3.0V supply, or can be programmed in a standard EPROM programmer.

The flash chips are compatible with the JEDEC Flash command set standard. The flash access time is 70ns and the PSRAM access time is 65ns.

Each Flash memory implements an architecture composed of two virtual banks that allows simultaneous operation on each bank. Optimized performance can be achieved by first initializing a program or erase function in one bank, then immediately starting a read from the other bank. Both operations would then be operating simultaneously on the same chip, with zero latency.

## Notes:

- Other operations except for indicated this column are prohibited.
- Do not apply  $\overline{CE}f = V_{IL}$ ,  $\overline{CE}1r = V_{IL}$  and  $CE2r = V_{IH}$  all at once.
- PSRAM Output Disable condition should not be kept longer than 1ms.
- $\overline{WE}$  can be V<sub>IL</sub> if  $\overline{OE}$  is V<sub>IL</sub>,  $\overline{OE}$  at V<sub>IH</sub> initiates the write operations.
- PSRAM  $\overline{LB}$ ,  $\overline{UB}$  control at Read operation is not supported.
- It is also used for the extended sector group protections.
- The PSRAM Power Down Program can be performed one time after compliance of Power-UP timings and it should not be re-programmed after regular Read or Write.
- PSRAM Power Down mode can be entered from Standby state and all DQ pins are in High-Z state. IPD<sub>r</sub> current and data retention depends on the selection of Power Down Program.
- Either or both  $\overline{LB}$  and  $\overline{UB}$  must be Low for PSRAM Read Operation.
- Can be either V<sub>IL</sub> or V<sub>IH</sub> but must be valid before Read or Write.
- See "PSRAM Power Down Program Key Table" located in the next page.
- Protect "outer most" 2x8K bytes ( 4 words ) on both ends of the boot block sectors.

**Notes:**

- 1) When multiple sector erase over several banks is operated, the system cannot read out of the bank to which a sector being erased belongs. For example, if erasing is taking place at both Bank A and Bank B, neither Bank A nor Bank B is read out. They would output the sequence flag once they were selected. Meanwhile the system would get to read from either Bank C or Bank D.
- 2) Each word is made-up of 2 bytes: one upper byte and one lower byte. A KWord is 2<sup>10</sup> words.

4	Read Mode	Erase Mode <sup>(1)</sup>
5	Autoselect Mode	Read Mode

7	Erase Mode <sup>(1)</sup>	Read Mode

**Note:**

- 1) By writing erase suspend command on the bank address of sector being erased, the erase operation gets suspended so that it enables reading from or programming the remaining sectors.
- 2) Bank 1 and Bank 2 are divided for the sake of convenience at Simultaneous Operation. Actually, the Bank consists of 4 banks, Bank A, Bank B, Bank C, and Bank D. Bank Address (BA) means to specify each of the Banks.

Manufacturer's Code	BA	L	L	L	L	L	04h
Device Code	BA	L	L	L	L	H	227Eh

Sector Group Protection	Sector Group Address	L	L	L	H	L	01h <sup>(1)</sup>

Legend: L = VIL, H = VIH. See "DC CHARACTERISTICS" for voltage levels.

**Notes:**

1. Outputs 01h at protected sector group addresses and outputs 00h at unprotected sector group addresses.
2. A read cycle at address (BA) 01h outputs device code. When 227Eh was output, this indicates that there will require two additional codes, called Extended Device Codes. Therefore the system may continue reading out these Extended Device Codes at the address of (BA) 0Eh, as well as at (BA) 0Fh.

**Notes:**

- Both Read/Reset commands are functionally equivalent, resetting the device to the read mode.
- This command is valid during Fast Mode.
- This command is valid while  $\overline{\text{RESET}} = \text{V}_{\text{ID}}$
- The valid address is A6 to A0.
- This command is valid during Hi-ROM mode.
- The data "00h" is also acceptable.

**FLASH MEMORY COMMAND DEFINITIONS - FLASH 1 or FLASH 2 (Continued)****Notes:**

- Address bits A21 to A11 = X = "H" or "L" for all address commands except Program Address (PA), Sector Address (SA), and Bank Address (BA), and Sector Group Address (SPA).
- Bus operations are defined in "DEVICE BUS OPERATIONS".
- RA = Address of the memory location to be read  
PA = Address of the memory location to be programmed. Addresses are latched on the falling edge of the write pulse.
- SA = Address of the sector to be erased. The combination of A21, A20, A19, A18, A17, A16, A15, A14, A13, and A12 will uniquely select any sector. BA = Bank Address (A21, A20, A19)
- RD = Data read from location RA during read operation.  
PD = Data to be programmed at location PA. Data is latched on the rising edge of the write pulse.
- SPA = Sector group address to be protected. Set sector group address and (A6, A3, A2, A1, A0) = (0, 0, 0, 1, 0).  
SD = Sector group protection verify data. Output 01h at protected sector group addresses and output 00h at unprotected sector group addresses.
- HRA = Address of the Hi-ROM area : 000000h to 00007Fh  
HRBA = Bank Address of the Hi-ROM area (A21 = A20 = A19 = VIL)
- The system should generate the following address patterns : 555h or 2AAh to addresses A10 to A0
- Both Read/Reset commands are functionally equivalent, resetting the device to the read mode.
- Command combinations not described in *FLASH Memory Command Definitions* are illegal.

## PSRAM POWER DOWN PROGRAM KEY TABLE

## Notes:

- 1: The Power Down Program can be performed one time after compliance of Power-up timings and it should not be re-programmed after regular Read or Write. Unspecified addresses, A0 to A15, can be either High or Low during the programming. The RESERVED key should not be used.
- 2: TOP area is from the lowest address location. (i.e., A[20:0] = H)
- 3: BOTTOM area is from the highest address location. (i.e., A[20:0] = L)
- 4: NAP and SLEEP do not retain the data and Area Select is ignored.
- 5: Default state. Power Down Program to this SLEEP mode can be omitted.

## Notes:

- The output load is 30 pF.
- The output load is 5 pF.
- The t<sub>CE</sub> is applicable if  $\overline{\text{OE}}$  is brought to Low before  $\overline{\text{CE}}1\text{r}$  goes Low and is also applicable if actual value of both or either t<sub>ASO</sub> or t<sub>CLOL</sub> is shorter than specified value.
- Applicable only to A0 and A1 when both  $\overline{\text{CE}}1\text{r}$  and  $\overline{\text{OE}}$  are kept at Low for the address access.
- Applicable if  $\overline{\text{OE}}$  is brought to Low before  $\overline{\text{CE}}1\text{r}$  goes Low.
- The t<sub>ASO</sub>, t<sub>CLOL</sub> (Min) and t<sub>OP</sub> (Min) are reference values when the access time is determined by t<sub>OE</sub>.  
If the actual value of each parameter is shorter than the specified minimum value, t<sub>OE</sub> becomes longer by the amount of subtracting actual value from specified minimum value.  
For example, if actual t<sub>ASO</sub>, t<sub>ASO</sub> (actual), is shorter than specified minimum value, t<sub>ASO</sub> (Min), during  $\overline{\text{OE}}$  control access (i.e.,  $\overline{\text{CE}}1\text{r}$  stays Low), the t<sub>OE</sub> becomes t<sub>OE</sub> (Max) + t<sub>ASO</sub> (Min) - t<sub>ASO</sub> (actual).
- The t<sub>ASO[ABS]</sub> and t<sub>OP[ABS]</sub> are the absolute minimum values during  $\overline{\text{OE}}$  control access.
- If actual value of either t<sub>CLOL</sub> or t<sub>OP</sub> is shorter than specified minimum value, both t<sub>OLAH</sub> and t<sub>OLCH</sub> become t<sub>RC</sub> (Min) - t<sub>CLOL</sub> (actual) or t<sub>RC</sub> (Min) - t<sub>OP</sub> (actual).
- Maximum value is applicable if  $\overline{\text{CE}}1\text{r}$  is kept at Low.

$\overline{\text{OE}}$ Hold Time <sup>(3,4)</sup>	t <sub>OEH</sub>	25	1000	ns
$\overline{\text{OE}}$ Hold Time <sup>(5)</sup>	t <sub>OEH(ABS)</sub>	12	—	ns
$\overline{\text{OE}}$ High to $\overline{\text{CE}}1\text{r}$ Low Setup Time <sup>(6)</sup>	t <sub>OHCL</sub>	-5	—	ns
$\overline{\text{OE}}$ High to Address Hold Time <sup>(7)</sup>	t <sub>OH AH</sub>	-5	—	ns
$\overline{\text{CE}}1\text{r}$ Write Pulse Width <sup>(1,8)</sup>	t <sub>CW</sub>	45	—	ns
$\overline{\text{WE}}$ Write Pulse Width <sup>(1,8)</sup>	t <sub>WP</sub>	45	—	ns
$\overline{\text{CE}}1\text{r}$ Write Recovery Time <sup>(1,9)</sup>	t <sub>WRC</sub>	10	—	ns
$\overline{\text{WE}}$ Write Recovery Time <sup>(1,3,9)</sup>	t <sub>WR</sub>	10	1000	ns
Data Setup Time	t <sub>DS</sub>	15	—	ns
Data Hold Time	t <sub>DH</sub>	0	—	ns
$\overline{\text{CE}}1\text{r}$ High Pulse Width <sup>(9)</sup>	t <sub>CP</sub>	12	—	ns

**Notes:**

- Minimum value must be equal or greater than the sum of actual t<sub>CW</sub> (or t<sub>WP</sub>) and t<sub>WRC</sub> (or t<sub>WR</sub>).
- New write address is valid from either  $\overline{\text{CE}}1\text{r}$  or  $\overline{\text{WE}}$  that is brought to High.
- Maximum value is applicable if  $\overline{\text{CE}}1\text{r}$  is kept at Low and both  $\overline{\text{WE}}$  and  $\overline{\text{OE}}$  are kept at High.
- The t<sub>OEH</sub> is specified from end of t<sub>WC</sub> (Min), and is a reference value when access time is determined by t<sub>OE</sub>. If actual value is shorter than specified minimum value, t<sub>OE</sub> becomes longer by the amount of subtracting actual value from specified minimum value.
- The t<sub>OEH[ABS]</sub> is the absolute minimum value if write cycle is terminated by  $\overline{\text{WE}}$  and  $\overline{\text{CE}}1\text{r}$  stay Low.
- t<sub>OHCL</sub> (Min) must be satisfied if read operation is not performed prior to write operation. In case  $\overline{\text{OE}}$  is disabled after t<sub>OHCL</sub> (Min),  $\overline{\text{WE}}$  Low must be asserted after t<sub>RC</sub> (Min) from  $\overline{\text{CE}}1\text{r}$  Low. In other words, read operation is initiated if t<sub>OHCL</sub> (Min) is not satisfied.
- Applicable if  $\overline{\text{CE}}1\text{r}$  stays Low after read operation.
- t<sub>CW</sub> and t<sub>WP</sub> are applicable if write operation is initiated by  $\overline{\text{CE}}1\text{r}$  and  $\overline{\text{WE}}$ , respectively.
- t<sub>WRC</sub> and t<sub>WR</sub> are applicable if write operation is terminated by  $\overline{\text{CE}}1\text{r}$  and  $\overline{\text{WE}}$ , respectively. The t<sub>WR</sub> (Min) can be ignored if  $\overline{\text{CE}}1\text{r}$  is brought to High together or after  $\overline{\text{WE}}$  is brought to High. In such a case, the t<sub>CP</sub> (Min) must be satisfied.

**CAUTION:**

- 1) The high voltage (VID) cannot be applied to address pins and control pins except RESET. Exception is when autoselect and sector group protection function are used. Then the high voltage (VID) can be applied to RESET.
- 2) Without the high voltage (VID) sector group protection can be achieved by using the "Extended Sector Group Protection" command.
