

## 256K x 16 Static RAM

#### **Features**

- · High speed
  - $t_{AA} = 12 \text{ ns}$
- · Low active power
  - 1540 mW (max.)
- · Low CMOS standby power (L version)
  - 2.75 mW (max.)
- 2.0V Data Retention (400 μW at 2.0V retention)
- · Automatic power-down when deselected
- TTL-compatible inputs and outputs
- Easy memory expansion with CE and OE features

#### **Functional Description**

The CY7C1041B is a high-performance CMOS static RAM organized as 262,144 words by 16 bits.

Writing to the device is accomplished by taking Chip Enable (CE) and Write Enable (WE) inputs LOW. If Byte Low Enable

 $\overline{(BLE)}$  is LOW, then data from I/O pins (I/O $_0$  through I/O $_7$ ), is written into the location specified on the address pins (A $_0$  through A $_{17}$ ). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O $_8$  through I/O $_{15}$ ) is written into the location specified on the address pins (A $_0$  through A $_{17}$ ).

Reading from the device is accomplished by taking Chip Enable (CE) and Output Enable (OE) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins will appear on I/O $_0$  to I/O $_7$ . If Byte High Enable (BHE) is LOW, then data from memory will appear on I/O $_8$  to I/O $_{15}$ . See the truth table at the back of this data sheet for a complete description of read and write modes.

The input/output pins (I/O $_0$  through I/O $_{15}$ ) are placed in a high-impedance state when the device is deselected (CE HIGH), the outputs are disabled (OE HIGH), the BHE and BLE are disabled (BHE, BLE HIGH), or during a write operation (CE LOW, and WE LOW).

The CY7C1041B is available in a standard 44-pin 400-mil-wide body width SOJ and 44-pin TSOP II package with center power and ground (revolutionary) pinout.

#### **Selection Guide**

#### Notes:

Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I<sub>OL</sub>/I<sub>OH</sub> and 30-pF load capacitance.
 This part has a voltage regulator which steps down the voltage from 5V to 3.3V internally. t<sub>power</sub> time has to be provided initially before a read/write operation is

<sup>6.</sup> t<sub>HZOE</sub>, t<sub>HZCE</sub>, and t<sub>HZWE</sub> are specified with a load capacitance of 5 pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady-state voltage.

At any given temperature and voltage condition, t<sub>HZCE</sub> is less than t<sub>LZOE</sub>, t<sub>HZCE</sub> is less than t<sub>LZOE</sub>, and t<sub>HZWE</sub> is less than t<sub>LZOE</sub> for any given device.
 The internal write time of the memory is defined by the overlap of CE LOW, and WE LOW. CE and WE must be LOW to initiate a write, and the transition of either of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.
 The minimum write cycle time for Write Cycle no. 3 (WE controlled, OE LOW) is the sum of t<sub>HZWE</sub> and t<sub>SD</sub>.

## Data Retention Characteristics Over the Operating Range (L version only)

| Parameter                       | Description                          |       |   | Conditions <sup>[11]</sup>                             | Min.            | Max. | Unit |
|---------------------------------|--------------------------------------|-------|---|--|-----------------|------|------|
| V <sub>DR</sub>                 | V <sub>CC</sub> for Data Retention   |       |   |  | 2.0             |      | V    |
| I <sub>CCDR</sub>               | Data Retention Current               | Com'l | L | $V_{CC} = V_{DR} = 3.0V$ ,<br>$CE \ge V_{CC} - 0.3V$ , |                 | 200  | mA   |
| t <sub>CDR</sub> <sup>[3]</sup> | Chip Deselect to Data Retention Time |       |   | $V_{IN} \ge V_{CC} - 0.3V$ or $V_{IN} \le 0.3V$        | 0               |      | ns   |
| t <sub>R</sub> <sup>[10]</sup>  | Operation Recovery Time              |       |   |  | t <sub>RC</sub> |      | ns   |

<sup>10.</sup>  $t_r \le 3$  ns for the -12 and -15 speeds.  $t_r \le 5$  ns for the -20 and slower speeds. 11. No input may exceed  $V_{CC}$  + 0.5V.

#### **Data Retention Waveform**

## **Switching Waveforms**

## Read Cycle No. 1<sup>[12, 13]</sup>

## Read Cycle No. 2 (OE Controlled)[13, 14]

#### Notes:

- 12. <u>Device</u> is continuously selected. <u>OE</u>, <u>CE</u>, <u>BHE</u>, and/or <u>BHE</u> = V<sub>IL</sub>.

  13. <u>WE</u> is HIGH for read cycle.
- 14. Address valid prior to or coincident with  $\overline{\text{CE}}$  transition LOW.

## Switching Waveforms (continued)

## Write Cycle No. 1 (CE Controlled)[15, 16]

## Write Cycle No. 2 (BLE or BHE Controlled)

<sup>15.</sup> Data I/O is high impedance if OE or BHE and/or BLE= V<sub>IH</sub>.

16. If CE goes HIGH simultaneously with WE going HIGH, the output remains in a high-impedance state.

## Switching Waveforms (continued)

## Write Cycle No. 3 (WE Controlled, OE LOW)

#### **Truth Table**

| CE | OE | WE | BLE | вне | I/O <sub>0</sub> –I/O <sub>7</sub> | I/O <sub>8</sub> -I/O <sub>15</sub> | Mode                       | Power                      |
