## PAGE MODE FLASH MEMORY CMOS

## $32 \mathrm{M}(2 \mathrm{M} \times 16 / 1 \mathrm{M} \times 32)$ BIT

## MBM29PL3200TE/BE 70/90

## ■ DESCRIPTION

The MBM29PL3200TE/BE is 32 M-bit, 3.0 V-only Page mode Flash memory organized as 2 M words of 16 bits each or 1 M words of 32 bits each. The device is offered in 90 -pin SSOP and 84 -ball FBGA packages. This device is designed to be programmed in-system with the standard system 3.0 V Vcc supply. 12.0 V Vpp and 5.0 V Vcc are not required for write or erase operations. The device can also be reprogrammed in standard EPROM programmers.

## MBM29PL3200TE/BE70/90

## (Continued)

The device provides truly high performance non-volatile Flash memory solution. The device offers fast page access times of 25 ns and 35 ns with random access times of 70 ns and 90 ns , allowing operation of high-speed microprocessors without wait states. To eliminate bus contention, the device has separate chip enable ( $\overline{\mathrm{CE}}$ ), write enable ( $\overline{\mathrm{WE}}$ ) and output enable $(\overline{\mathrm{OE}})$ controls. The page size is 8 words or 4 double words.
The device is command set compatible with JEDEC standard E²PROMs. Commands are written to the command register using standard microprocessor write timings. Register contents serve as input to an internal statemachine which controls the erase and programming circuitry. Write cycles also internally latch addresses and data needed for the programming and erase operations. Reading data out of the device is similar to reading from 5.0 V and 12.0 V Flash or EPROM devices.

The device is programmed by executing the program command sequence. This will invoke the Embedded Program ${ }^{\text {TM }}$ * Algorithm, which is an internal algorithm that automatically times the program pulse widths and verifies proper cell margins. Typically, each sector can be programmed and verified in about 2.2 seconds. Erase is accomplished by executing the erase command sequence. This will invoke the Embedded Erase ${ }^{\text {TM }}$ * Algorithm, which is an internal algorithm that automatically preprograms the array if it is not already programmed before executing the erase operation. During erase, the device automatically times the erase pulse widths and verifies proper cell margins.

Any individual sector is typically erased and verified in 4.8 second. (If already preprogrammed.)
The device also features a sector erase architecture. The sector mode allows each sector to be erased and reprogrammed without affecting other sectors. The device is erased when shipped from the factory.
The device features single 3.0 V power supply operation for both read and write functions. Internally generated and regulated voltages are provided for the program and erase operations. A low $\mathrm{V}_{\mathrm{cc}}$ detector automatically inhibits write operations on the loss of power. The end of program or erase is detected by Data Polling of DQ7, by the Toggle Bit feature on $\mathrm{DQ}_{6}$, output pin. Once the end of a program or erase cycle has been completed, the device internally resets to the read mode.

Fujitsu's Flash technology combines years of Flash memory manufacturing experience to produce the highest levels of quality, reliability, and cost effectiveness. The device memory electrically erases all bits within a sector simultaneously via Fowler-Nordhiem tunneling. The words/double words are programmed one word/double word at a time using the EPROM programming mechanism of hot electron injection.
*: Embedded Erase ${ }^{\top \mathrm{M}}$ and Embedded Program ${ }^{\text {TM }}$ are trademarks of Advanced Micro Devices, Inc.

## - FEATURES

- $0.23 \mu \mathrm{~m}$ Process Technology
- Single 3.0 V read, program and erase

Minimized system level power requirements

- High Performance Page Mode

25 ns maximum page access time ( 70 ns random access time)

- 8 words Page ( $\times 16$ ) /4 double words ( $\times 32$ ) size
- Compatible with JEDEC-standard commands

Uses same software commands as E²PROMs

- Compatible with JEDEC-standard world-wide pinouts

90-pin SSOP (Package suffix : PFV)
84-ball FBGA (Package suffix : PBT)

- Minimum 100,000 program/erase cycles
- Sector erase architecture

One 16 K word, two 8 K words, one 96 K word, and fifteen 128 K words sectors in word mode ( $\times 16$ )
One 8 K double word, two 4 K double words, one 48 K double word, and fifteen 64 K double words sectors in double word mode ( $\times 32$ )
Any combination of sectors can be concurrently erased. Also supports full chip erase

## MBM29PL3200TE/BE $70 / 90$

- Boot Code Sector Architecture

T = Top sector
B = Bottom sector

- Embedded Erase ${ }^{\text {TM }}$ Algorithms

Automatically pre-programs and erases the chip or any sector

- Embedded Program ${ }^{\text {TM }}$ Algorithms

Automatically programs and verifies data at specified address

- Data Polling and Toggle Bit feature for detection of program or erase cycle completion
- Automatic sleep mode

When addresses remain stable, automatically switches themselves to low power mode

- Low Vcc write inhibit $\leq 2.5 \mathrm{~V}$
- Erase Suspend/Resume

Suspends the erase operation to allow a read data and/or program in another sector within the same device

- Sector protection

Hardware method disables any combination of sectors from program or erase operations

- Fast Programming Function by Extended command
- Temporary sector unprotection

Temporary sector unprotection with the software command

- In accordance with CFI (Common Flash Memory Interface)

(Continued)

## MBM29PL3200TE/BE 70990

(Continued)
DW : Double Word
W : Word
*1: This command is valid while Fast Mode.
*2: The valid addresses are $\mathrm{A}_{6}$ to $\mathrm{A}_{0}$.
*3: This command is valid while Hi -ROM mode.
*4: The data "00h" is also acceptable.
Notes : 1.Address bits $A_{19}$ to $A_{11}=X=$ " $H$ " or " L " for all address commands except or Program Address (PA), and Sector Address (SA).
2. Bus operations are defined in Tables 2 and 3.
3. $R A=$ Address of the memory location to be read

PA = Address of the memory location to be programmed
Addresses are latched on the falling edge of the write pulse.
$S A=$ Address of the sector to be erased. The combination of $\mathrm{A}_{19}, \mathrm{~A}_{18}, \mathrm{~A}_{17}, \mathrm{~A}_{16}, \mathrm{~A}_{15}, \mathrm{~A}_{14}, \mathrm{~A}_{13}$ and $\mathrm{A}_{12}$ will uniquely select any sector.
4. $\mathrm{RD}=$ Data read from location RA during read operation.

PD = Data to be programmed at location PA. Data is latched on the falling edge of write pulse.
5. $\mathrm{HRA}=$ Address of the Hi -ROM area Word Mode : 000000h to 000100h

Double Word Mode : 000000h to 000080h
6.The system should generate the following address patterns :

DW (Double Word) Mode : 555h or 2AAh to addresses $A_{10}$ to $A_{0}$
W (Word) Mode : AAAh or 555h to addresses $\mathrm{A}_{10}$ to $\mathrm{A}_{0}$, and A-1
7.Both Read/Reset commands are functionally equivalent, resetting the device to the read mode.

| Temporary Sector Unprotection |  | X | VIL | VIL | VIL | $\mathrm{V}_{1}$ | V ${ }_{\text {H }}$ | VIL | 01h *3 |

*1 : A-1 is for Word mode. In double word mode, DQ15 to DQ30 become "High-Z" and DQ31 becomes the lower address "A-1".
*2 : Outputs 01 h at protected sector addresses and outputs 00 h at unprotected sector addresses.
*3 : Outputs 01h at Temporary Sector Unprotection and outputs 00h at Non Temporary Sector Unprotection.

## MBM29PL3200TE/BE70990

## FUNCTIONAL DESCRIPTION

## Read Mode

The device has two control functions which must be satisfied in order to obtain data at the outputs. $\overline{\mathrm{CE}}$ is the power control and should be used for device selection. OE is the output control and should be used to gate data to the output pins when a device is selected.
Address access time (tacc) is equal to the delay from stable addresses to valid output data. The chip enable access time (tcE) is the delay from stable addresses and stable $\overline{\mathrm{CE}}$ to valid data at the output pins. The output enable access time is the delay from the falling edge of $\overline{O E}$ to valid data at the output pins (assuming the addresses have been stable prior to $t_{A c c}-t_{\text {te }}$ time). When reading out data without changing addresses after power-up, it is necessary to input hardware reset or to change CE pin from " H " to " L ".

## Page Mode Read

The device is capable of fast Page mode read and is compatible with the Page mode Mask ROM read operation. This mode provides faster read access speed for random locations within a page. The Page size of the device is 8 words, or 4 double words, within the appropriate Page being selected by the higher address bits $A_{19}$ to $A_{2}$ and the LSB bits $A_{1}$ to $A_{0}$ (in double word mode) and $A_{1}$ to $A_{-1}$ (in word mode) determining the specific double word/word within that page. This is an asynchronous operation with the microprocessor supplying the specific double word or word location.

The random or initial page access is equal to tacc and subsequent Page read access (as long as the locations specified by the microprocessor fall within that Page) is equivalent to tracc. Here again, $\overline{\mathrm{CE}}$ selects the device and $\overline{O E}$ is the output control and should be used to gate data to the output pins if the device is selected. Fast Page mode accesses are obtained by keeping $A_{19}$ to $A_{2}$ constant and changing $A_{1}$ and $A_{0}$ to select the specific double word, or changing $\mathrm{A}_{1}$ to $\mathrm{A}_{-1}$ to select the specific word within that page. See Figure 5.2 for timing specifications.

## Standby Mode

The device has CMOS standby mode ( $\overline{\mathrm{CE}}$ input held at $\mathrm{V} \mathrm{cc} \pm 0.3 \mathrm{~V}$.), when the current consumed is less than $50 \mu \mathrm{~A}$. In the standby mode, the output pins are in a high impedance state, independent of $\overline{\mathrm{OE}}$ input.
During Embedded Algorithm operation, $\mathrm{V}_{\mathrm{cc}}$ Active current (lcc2) is required even if $\overline{\mathrm{CE}}=$ " H ". The device can be read with standard access time (tcE) from either of these standby modes.
In the standby mode, the output pins are in the high impedance state, independent of $\overline{\mathrm{OE}}$ input.

## Automatic Sleep Mode

Automatic sleep mode lower consumption during read-out of the device data. This mode can be useful for applications such as a handy terminal that requires low power consumption.
To activate this mode, the device automatically switches itself to low power mode when addresses remain stable during access time of 150 ns . It is not necessary to control $\overline{\mathrm{CE}}, \overline{\mathrm{WE}}$ and $\overline{\mathrm{OE}}$ in this mode. In this mode, the current consumed is typically $50 \mu \mathrm{~A}$ (CMOS Level).
Since the data are latched during this mode, they are read out continuously. If the addresses are changed, this mode is canceled automatically, and the device reads the data for changed addresses.

## Output Disable

With the $\overline{\mathrm{OE}}$ input is at a logic high level $\left(\mathrm{V}_{\boldsymbol{H}}\right)$, output from the device is disabled. This will put the output pins in a high impedance state.

## Autoselect

The autoselect mode allows the reading out of a binary code from the device and will identify its manufacturer and type. This mode is intended for use by programming equipment for the purpose of automatically matching the device to be programmed with its corresponding programming algorithm. This mode is functional over the entire temperature range of the device.

## MBM29PL3200TE/BE70/90

To activate this mode, the programming equipment must force $\mathrm{V}_{10}$ on address pin A9. Three identifier words may then be sequenced from the device outputs by toggling address $A_{0}$ and $A_{1}$ from $\mathrm{V}_{\mathrm{IL}}$ to $\mathrm{V}_{\mathrm{I}}$. All addresses are DON'T CAREs except $A_{6}, A_{3}, A_{2}, A_{1}$, and $A_{0}\left(A_{-1}\right)$. (See Tables 2 and 3.)
The manufacturer and device codes may also be read via the command register, for instance when the device is erased or programmed in a system without access to high voltage on the $\mathrm{A}_{9}$ pin. The command sequence is illustrated in Table 11. (Refer to Autoselect Command section.)
A read cycle from address 00 h returns the manufacturer's code (Fujitsu $=04 \mathrm{~h}$ ). A read cycle from address 01 h , OEh to 0Fh returns the device code. (See Tables 5.1 to 5.4.)
In order to determine which sectors are write protected, $\mathrm{A}_{1}$ must be at $\mathrm{V}_{\mathbb{H}}$ while running through the sector addresses; if the selected sector is protected, a logical ' 1 ' will be output on $\mathrm{DQ}_{0}\left(\mathrm{DQ}_{0}=1\right.$ ).

## Write

The device erasure and programming are accomplished via the command register. The contents of the register serve as inputs to the internal state machine. The state machine outputs dictate the function of the device.

The command register itself does not occupy any addressable memory location. The register is a latch used to store the commands, along with the address and data information needed to execute the command. The command register is written by bringing $\overline{W E}$ to $\mathrm{V}_{\mathrm{LL}}$, while $\overline{\mathrm{CE}}$ is at $\mathrm{V}_{\mathrm{IL}}$ and $\overline{\mathrm{OE}}$ is at $\mathrm{V}_{\mathrm{IH}}$. Addresses are latched on the falling edge of $\overline{W E}$ or $\overline{C E}$, whichever happens later, while data is latched on the rising edge of $\overline{W E}$ or $\overline{C E}$, whichever happens first. Standard microprocessor write timings are used.
Refer to AC Write Characteristics and the Erase/Programming Waveforms for specific timing parameters.

## Sector Protection

The device features hardware sector protection. This feature will disable both program and erase operations in any number of sectors ( 0 through 18). The sector protection feature is enabled using programming equipment at the user's site. The device is shipped with all sectors unprotected.
To activate this mode, the programming equipment must force $\mathrm{V}_{\mathrm{ID}}$ on address pin A 9 and control pin $\overline{\mathrm{OE}}, \overline{\mathrm{CE}}=$ $\mathrm{V}_{\mathrm{IL}}, \mathrm{A}_{6}=\mathrm{A}_{3}=\mathrm{A}_{2}=\mathrm{A}_{0}=\mathrm{V}_{\mathrm{LL}}, \mathrm{A}_{1}=\mathrm{V}_{1 \text { H. }}$. The sector address pins ( $\mathrm{A}_{19}, \mathrm{~A}_{18}, \mathrm{~A}_{17}, \mathrm{~A}_{16}, \mathrm{~A}_{15}, \mathrm{~A}_{14}, \mathrm{~A}_{13}$, and $\mathrm{A}_{12}$ ) should be set to the sector to be protected. Tables 7 and 8 define the sector address for each of the nineteen (19) individual sectors. Programming of the protection circuitry begins on the falling edge of the WE pulse and is terminated with the rising edge of the same. Sector addresses must be held constant during the WE pulse. See Figures 15 and 21 for sector protection waveforms and algorithms.

To verify programming of the protection circuitry, the programming equipment must force $V_{I D}$ on address pin $A_{9}$ with $\overline{\mathrm{CE}}$ and $\overline{\mathrm{OE}}$ at $\mathrm{V}_{12}$ and $\overline{\mathrm{WE}}$ at $\mathrm{V}_{14}$. Scanning the sector addresses ( $\mathrm{A}_{19}, \mathrm{~A}_{18}, \mathrm{~A}_{17}, \mathrm{~A}_{16}, \mathrm{~A}_{15}, \mathrm{~A}_{14}, \mathrm{~A}_{13}$, and $\mathrm{A}_{12}$ ) while $\left(A_{6}, A_{3}, A_{2}, A_{1}, A_{0}\right)=(0,0,0,1,0)$ will produce a logical " 1 " at device output $D_{0}$ for a protected sector. Otherwise the device will read 00 h for an unprotected sector. In this mode, the lower order address, except for $A_{0}, A_{1}$ and $A_{6}$ are DON'T CAREs. Address locations with $A_{1}=V_{I L}$ are reserved for Autoselect manufacturer and device codes. A-1 requires to $\mathrm{V}_{\mathrm{IL}}$ in word mode.

It is also possible to determine if a sector is protected in the system by writing an Autoselect command. Performing a read operation at the address location XX02h, where the higher order address pins ( $\mathrm{A}_{19}, \mathrm{~A}_{18}, \mathrm{~A}_{17}, \mathrm{~A}_{16}, \mathrm{~A}_{15}, \mathrm{~A}_{14}$, $A_{13}$ and $A_{12}$ ) represents the sector address will produce a logical "1" at DQ for a protected sector. See Tables 5.1 to 5.4 for Autoselect codes.

## Temporary Sector Unprotection

This feature allows temporary unprotection of previously protected sectors of the device in order to change data. The Sector Unprotection mode is activated by the command register. In this mode, formerly protected sectors can be programmed or erased by selecting the sector addresses. Once the mode is taken away using the command register, all previously protected sectors will be protected again. (See Figure 22.)

## MBM29PL3200TE/BE $70 / 90$

## Boot Block Sector Protection

The Write Protection function provides a hardware method of protecting certain "outermost" 16 K word ( $\times 16$ mode) sector without using $V_{I D}$.
If the system asserts VIL on the $\overline{\mathrm{WP}}$ pin, the device disables program and erase functions in the "outermost" 16 K word sector independently of whether this sector was protected or unprotected using the method described in "Sector Protection/Unprotection". The outermost 16 K word sector is the highest addresses in MBM29PL3200TE, or the lowest addresses in MBM29PL3200BE.
(MBM29PL3200TE : SA18, MBM29PL3200BE : SA0)
If the system asserts VIL on the $\overline{\mathrm{WP}}$ pin, the device reverts to whether the outermost 16 K word sector was last set to be protected or unprotected. That is, sector protection or unprotection for this sector depends on whether this was last protected or unprotected using the method described in "Sector protection/unprotection".

## Accelerated Program Operation

The device offers accelerated program operation which enables high-speed programming. If the system asserts $V_{A C C}$ to the ACC pin, the device automatically enters the acceleration mode and the time required for program operation will reduce to about $60 \%$. This function is primarily intended to allow high-speed programming, so caution is needed as the sector group will temporarily be unprotected.
The system would use a fast program command sequence when programming during acceleration mode. Set command to fast mode and reset command from fast mode are not necessary. When the device enters the acceleration mode, the device is automatically set to fast mode. Therefore, the present sequence could be used for programming and detection of completion in acceleration mode.
Removing VACc from the ACC pin returns the device to normal operation. Do not remove VACC from the ACC pin while programming. See Figure 16.

## MBM29PL3200TE/BE70/90

## ■ COMMAND DEFINITIONS

The device operations are selected by writing specific address and data sequences into the command register. Writing incorrect address and data values or writing them in an improper sequence will reset the device to the read mode. Table 4 defines the valid register command sequences. Note that the Erase Suspend (BOh) and Erase Resume (30h) commands are valid only while the Sector Erase operation is in progress. Moreover both Read/Reset commands are functionally equivalent, resetting the device to the read mode. Please note that commands are always written at $\mathrm{DQ}_{15}$ to $\mathrm{DQ}_{0}$ and $\mathrm{DQ}_{31}$ to $\mathrm{DQ}_{16}$ bits are ignored.

## Read/Reset Command

In order to return from Autoselect mode or Exceeded Timing Limits $\left(\mathrm{DQ}_{5}=1\right)$ to Read/Reset mode, the Read/ Reset operation is initiated by writing the Read/Reset command sequence into the command register. Microprocessor read cycles retrieve array data from the memory. The device remains enabled for reads until the command register contents are altered.

The device will automatically power-up in the Read/Reset state. In this case, a command sequence is not required to read data. Standard microprocessor read cycles will retrieve array data. This default value ensures that no spurious alteration of the memory content occurs during the power transition. Refer to the AC Read Characteristics and Waveforms for specific timing parameters.

## Autoselect Command

Flash memories are intended for use in applications where the local CPU alters memory contents. As such, both manufacture and device codes must be accessible while the device resides in the target system. PROM programmers typically access the signature codes by raising $A_{9}$ to a high voltage. However, multiplexing high voltage onto the address lines is not generally desired system design practice.
The device contains an Autoselect command operation to supplement traditional PROM programming methodology. The operation is initiated by writing the Autoselect command sequence into the command register. Following the last command write, a read cycle from address XX00h retrieves the manufacture code of 04 h . A read cycle at address XX01h (XX02h for $\times 8$ ) returns 7Eh indicating that this device uses an extended device code. The successive read cycle from XX0Eh to XX0Fh returns this extended device code for this device. (See Tables 5.1 to 5.4.)

The sector state (protection or unprotection) will be indicated by address XX02h for $\times 32$ (XX04h for $\times 16$ ). Scanning the sector addresses ( $A_{19}, A_{18}, A_{17}, A_{16}, A_{15}, A_{14}, A_{13}$ and $A_{12}$ ) while ( $A_{6}, A_{3}, A_{2}, A_{1}, A_{0}$ ) $=(0,0,0,1,0)$ will produce a logical " 1 " at device output $\mathrm{DQ}_{0}$ for a protected sector. The programming verification should perform margin mode verification on the protected sector. (See Tables 2 and 3.)
To terminate the operation, it is necessary to write the Read/Reset command sequence into the register and to write the Autoselect command during the operation by executing it after writing the Read/Reset command sequence.

## Word/Double Word Programming

The device is programmed on a word-by-word (or double word-by-double word) basis. Programming is a four bus cycle operation. There are two "unlock" write cycles. These are followed by the program set-up command and data write cycles. Addresses are latched on the falling edge of $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$, whichever happens later, and the data is latched on the rising edge of $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$, whichever happens first. The rising edge of the last $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$ (whichever happens first) begins programming. Upon executing the Embedded Program Algorithm command sequence, the system is not required to provide further controls or timings. The device will automatically provide adequate internally generated program pulses and verify the programmed cell margin. (See Figures 6 and 7.)
The system can determine the status of the program operation by using DQ ( $\overline{\text { Data }}$ Polling), or DQ (Toggle Bit). The Data Polling and Toggle Bit must be performed at the memory location which is being programmed.
The automatic programming operation is completed when the data on $\mathrm{DQ}_{7}$ is equivalent to data written to this bit. Then, the device return to the read mode and addresses are no longer latched. (See Table 10, Hardware Sequence Flags.) Therefore, the device requires that a valid address be supplied by the system at this time. Hence, Data Polling must be performed at the memory location which is being programmed.

## MBM29PL3200TE/BE70990

Any commands written to the chip during this period will be ignored.
Programming is allowed in any sequence and across sector boundaries. Beware that a data "0" cannot be programmed back to a "1". Attempting to do so may either hang up the device or result in an apparent success according to the data polling algorithm but a read from Read/Reset mode will show that the data is still " 0 ". Only erase operations can convert " 0 "s to " 1 "s.
Figure 17 illustrates the Embedded Program ${ }^{\text {™ }}$ Algorithm using typical command strings and bus operations.

## Chip Erase

Chip erase is a six-bus cycle operation. There are two "unlock" write cycles. These are followed by writing the "set-up" command. Two more "unlock" write cycles are then followed by the chip erase command.
Chip erase does not require the user to program the device prior to erase. Upon executing the Embedded Erase Algorithm command sequence, the device will automatically program and verify the entire memory for an allzero data pattern prior to electrical erase (Preprogram Function). The system is not required to provide any controls or timings during these operations.

The system can determine the status of the erase operation by using DQ7 (Data Polling), or DQ6 (Toggle Bit). The chip erase begins on the rising edge of the last $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$, whichever happens first in the command sequence and terminates when the data on DQ7 is "1" (See Write Operation Status section), at which time the device returns to the read mode.
Chip Erase Time $=$ Sector Erase Time $\times$ All sectors + Chip Program Time (Preprogramming)
Figure 18 illustrates the Embedded Erase ${ }^{\text {TM }}$ Algorithm using typical command strings and bus operations.

## Sector Erase

Sector erase is a six bus cycle operation. There are two "unlock" write cycles. These are followed by writing the "set-up" command. Two more "unlock" write cycles are then followed by the Sector Erase command. The sector address (any address location within the desired sector) is latched on the falling edge of $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$, whichever happens later, while the command ( $\operatorname{Data}=30 \mathrm{~h}$ ) is latched on the rising edge of $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$, which happens first. After time-out of "trow" from the rising edge of the last sector erase command, the sector erase operation will begin.

Multiple sectors may be erased concurrently by writing the six bus cycle operations on Table 4. This sequence is followed with writes of the Sector Erase command (30h) to addresses in other sectors desired to be concurrently erased. The time between writes must be less than "trow", or that command will not be accepted and erasure will not start. It is recommended that processor interrupts be disabled during this time to guarantee this condition. The interrupts can be re-enabled after the last Sector Erase command is written. A time-out of "trow" from the rising edge of last $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$, whichever happens first, will initiate the execution of the Sector Erase command (s). If another falling edge of $\overline{C E}$ or $\overline{W E}$, whichever happens first, occurs within the "trow" time-out window, the timer is reset. (Monitor DQ ${ }_{3}$ to determine if the sector erase timer window is still open; see section $\mathrm{DQ}_{3}$, Sector Erase Timer.) Any command other than Sector Erase or Erase Suspend during this time-out period will reset the device to the read mode, ignoring the previous command string. In that case, restart the erase on those sectors and allow them to complete. (Refer to Write Operation Status section for Sector Erase Timer operation.) Loading the sector erase buffer may be done in any sequence and with any number of sectors (0 to 19).
Sector erase does not require the user to program the device prior to erase. The device automatically programs all memory locations in the sector (s) to be erased prior to electrical erase (Preprogram function). When erasing a sector or sectors, the remaining unselected sectors are not affected. The system is not required to provide any controls or timings during these operations.
The system can determine the status of the erase operation by using DQ ( $\overline{\text { Data }}$ Polling) or DQ (Toggle Bit).
The sector erase begins after the "trow" time out from the rising edge of $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$, whichever happens first ,for the last sector erase command pulse and terminates when the data on DQ is "1" (See Write Operation Status section), at which time the device returns to the read mode. Data polling and Toggle Bit must be performed at an address within any of the sectors being erased.
Multiple Sector Erase Time $=[$ Sector Erase Time + Sector Program Time (Preprogramming) $] \times$ Number of Sector Erase.

## MBM29PL3200TE/BE $70 / 90$

## Erase Suspend/Resume

The Erase Suspend/Resume command allows the user to interrupt a Sector Erase operation and then perform data reads from or programs to a sector not being erased. Erase suspend command is applicable ONLY during the Sector Erase operation, which includes the time-out period for sector erase. The Erase Suspend command will be ignored if written during the Chip Erase operation or Embedded Program Algorithm. Writing the Erase Suspend command (BOh) during the Sector Erase time-out results in immediate termination of the time-out period and suspension of the erase operation.
Writing the Erase Resume command (30h) resumes the erase operation. The addresses are "DON'T CAREs" when writing the Erase Suspend or Erase Resume command.

When the Erase Suspend command is written during the Sector Erase operation, the device will take a maximum of "tspD" to suspend the erase operation. When the device has entered the erase-suspended mode, the DQ7 bit will be at logic "1" and DQ6 will stop toggling. The user must use the address of the erasing sector for reading $\mathrm{DQ}_{6}$ and DQ7 to determine if the erase operation has been suspended. Further writes of the Erase Suspend command are ignored.
When the erase operation has been suspended, the device defaults to the erase-suspend-read mode. Reading data in this mode is the same as reading from the standard read mode except that the data must be read from sectors that have not been erase-suspended. Successively reading from the erase-suspended sector while the device is in the erase-suspend-read mode will cause $\mathrm{DQ}_{2}$ to toggle. (See the section on DQ2.)
After entering the erase-suspend-read mode, the user can program the device by writing the appropriate command sequence for Program. This program mode will become the erase-suspend-program mode. Again, programming in this mode is the same as programming in the regular Program mode except that the data must be programmed to sectors that are not erase-suspended. Successively reading from the erase-suspended sector while the device is in the erase-suspend-program mode will cause $\mathrm{DQ}_{2}$ to toggle. The end of the erase-suspended Program operation is detected by the Data polling of $\mathrm{DQ}_{7}$ or by the Toggle Bit I ( $\mathrm{DQ}_{6}$ ), which is the same as the regular Program operation. Note that DQ7 must be read from the Program address while DQ 6 can be read from any address.

To resume the operation of Sector Erase, the Resume command (30h) should be written. Any further writes of the Resume command at this point will be ignored. Another Erase Suspend command can be written after the chip has resumed erasing.

## MBM29PL3200TE/BE70990

## Extended Command

(1) Fast Mode

The device has a Fast Mode function. This mode dispenses with the initial two unlock cycles required in the standard program command sequence by writing a Fast Mode command into the command register. In this mode, the required bus cycle for programming is two cycles instead of four bus cycles in standard program command. (Do not write erase command in this mode.) The read operation is also executed after exiting this mode. To exit this mode, it is necessary to write a Fast Mode Reset command into the command register. (Refer to Figure 23.) The $V_{c c}$ active current is required even if $\overline{C E}=\mathrm{V}_{\boldsymbol{H}}$ during Fast Mode.
(2) Fast Programming

In Fast Mode, the programming can be executed with two bus cycle operation. The Embedded Program Algorithm is executed by writing a program set-up command (A0h) and data write cycles (PA/PD). (Refer to Figure 23.)

## (3) CFI (Common Flash Memory Interface)

The CFI (Common Flash Memory Interface) specification outlines the device and host system software interrogation handshake which allows specific vendor-specified software algorithms to be used for entire families of the device. This allows device-independent, JEDEC ID-independent, and forward-and backward-compatible software support for the specified flash device families. Refer to CFI specification in detail.
The operation is initiated by writing the query command (98h) into the command register. Following the command write, a read cycle from specific address retrieves device information. Please note that output data of upper byte ( $\mathrm{DQ}_{15}$ to $\mathrm{DQ}_{8}$ ) is " 0 " in word mode (16 bit) read. Refer to the CFI code table. To terminate operation, it is necessary to write the Read/Reset command sequence into the register.

## MBM29PL3200TE/BE70/90

## Hidden ROM (Hi-ROM) Region

The Hi-ROM feature provides a Flash memory region that the system may access through a new command sequence. This is primarily intended for customers who wish to use an Electronic Serial Number (ESN) in the device with the ESN protected against modification. Once the Hi-ROM region is protected, any further modification of that region is impossible. This ensures the security of the ESN once the product is shipped to the field.
The Hi-ROM region is 512 words in length. After the system has written the Enter Hi-ROM command sequence, it may read the Hidden ROM region by using device addresses $A_{7}$ to $A_{0}$ ( $A_{11}$ to $A_{8}$ are " 00 ", $A_{19}$ to $A_{12}$ are don't care). That is, the device sends only program command that would normally be sent to the address to the Hi ROM region. This mode of operation continues until the system issues the Exit Hi-ROM command sequence, or until power is removed from the device. On power-up, or following a hardware reset, the device reverts to sending commands to the address.

## Hidden ROM (Hi-ROM) Entry Command

The device has a Hidden ROM area with One Time Protect function. This area is to enter the security code and to unable the change of the code once set. Program/erase is possible in this area until it is protected. However, once it is protected, it is impossible to unprotect, so please use this with caution.
Hidden ROM area is 512 words. This area is normally the "outermost" 16 K word boot block area. Therefore, write the Hidden ROM entry command sequence to enter the Hidden ROM area. It is called Hidden ROM mode when the Hidden ROM area appears.

## Hidden ROM (Hi-ROM) Program Command

To program the data to the Hidden ROM area, write the Hidden ROM program command sequence during Hidden ROM mode. This command is the same as the program command in usual except to write the command during Hidden ROM mode. Therefore the detection of completion method is the same as in the past, using the DQ7 data polling, and $\mathrm{DQ}_{6}$ toggle bit. Need to pay attention to the address to be programmed. If the address other than the Hidden ROM area is selected to program, data of the address will be changed.

## Hidden ROM (Hi-ROM) Protect Command

The method to protect the Hidden ROM is to apply high voltage ( VID ) to $\mathrm{A}_{9}$ and $\overline{\mathrm{OE}}$, set the sector address in the Hidden ROM area and $\left(A_{6}, A_{3}, A_{2}, A_{1}, A_{0}\right)=(0,0,0,1,0)$, and apply the write pulse during the Hidden ROM mode. To verify the protect circuit, apply high voltage (VID) to $A_{9}$, specify $\left(A_{6}, A_{3}, A_{2}, A_{1}, A_{0}\right)=(0,0,0,1,0)$ and the sector address in the Hidden ROM area, and read. When " 1 " appears on $\mathrm{DQ}_{0}$, the protect setting is completed. " 0 " will appear on $\mathrm{DQ}_{0}$ if it is not protected. Please apply write pulse agian. The same command sequence could be used for the above method because other than the Hidden ROM mode, it is the same as the sector protect in the past. Please refer to "Function Explanation Secor Protection" for details of the sector protect setting.

Other sector will be effected if the address other than those for Hidden ROM area is selected for the sector address, so please be carefull. Once it is protected, protection can not be cancelled, so please pay the closest attention.

## MBM29PL3200TE/BE70990

## Write Operation Status

Detailed in Table 10 are all the status flags that can be used to check the status of the device for current mode operation. During sector erase, the part provides the status flags automatically to the I/O ports. The information on $\mathrm{DQ}_{2}$ is address sensitive. This means that if an address from an erasing sector is consecutively read, then the $\mathrm{DQ}_{2}$ bit will toggle. However, $\mathrm{DQ}_{2}$ will not toggle if an address from a non-erasing sector is consecutively read. This allows users to determine which sectors are in erase and which are not.
Once erase suspend is entered, address sensitivity still applies. If the address of a non-erasing sector (that is, one available for read) is provided, then stored data can be read from the device. If the address of an erasing sector (that is, one unavailable for read) is applied, the device will output its status bits.

Table 10 Hardware Sequence Flags

| Status |  |  | $\mathrm{DQ}_{7}$ | DQ6 | DQ5 | $\mathrm{DQ}_{3}$ | DQ ${ }_{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In Progress | Embedded Program Algorithm |  | $\overline{\mathrm{DQ}}_{7}$ | Toggle | 0 | 0 | 1 |
|  | Embedded Erase Algorithm |  | 0 | Toggle | 0 | 1 | Toggle * |
|  | Erase <br> Suspended <br> Mode | Erase Suspend Read (Erase Suspended Sector) | 1 | 1 | 0 | 0 | Toggle |
|  |  | Erase Suspend Read (Non-Erase Suspended Sector) | Data | Data | Data | Data | Data |
|  |  | Erase Suspend Program (Non-Erase Suspended Sector) | $\overline{\mathrm{DQ}}_{7}$ | Toggle | 0 | 0 | 1 * |
| Exceeded <br> Time Limits | Embedded Program Algorithm |  | $\overline{\mathrm{DQ}}_{7}$ | Toggle | 1 | 0 | 1 |
|  | Embedded Erase Algorithm |  | 0 | Toggle | 1 | 1 | N/A |
|  | Erase Suspend Program <br> (Non-Erase Suspended Sector) |  | $\overline{\mathrm{DQ}}{ }_{7}$ | Toggle | 1 | 0 | N/A |

*: Successive reads from the erasing or erase-suspend sector will cause DQ2 to toggle. Reading from non-erase suspend sector address will indicate logic "1" at the DQ2 bit.
Notes : 1. $\mathrm{DQ}_{0}$ and $\mathrm{DQ}_{1}$ are reserve pins for future use.
2. $\mathrm{DQ}_{4}$ is Fujitsu internal use only.

## MBM29PL3200TE/BE70/90

## DQ7

## Data Polling

The device features Data Polling as a method to indicate to the host that the Embedded Algorithms are in progress or completed. During the Embedded Program Algorithm an attempt to read the device will produce a complement of data last written to DQ7. Upon completion of the Embedded Program Algorithm, an attempt to read the device will produce true data last written to DQ7. During the Embedded Erase Algorithm, an attempt to read the device will produce a " 0 " at the $\mathrm{DQ}_{7}$ output. Upon completion of the Embedded Erase Algorithm an attempt to read the device will produce a "1" on DQ7. The flowchart for Data Polling ( $\mathrm{DQ}_{7}$ ) is shown in Figure 19.

For programming, the $\overline{\text { Data }}$ Polling is valid after the rising edge of the fourth write pulse in the four write pulse sequence.

For chip erase and sector erase, the $\overline{\text { Data }}$ Polling is valid after the rising edge of the sixth write pulse in the six write pulse sequence. Data Polling must be performed at the sector address of sectors being erased, not protected sectors. Otherwise, the status may be invalid.
Once the Embedded Algorithm operation is close to being completed, the device data pins (DQ7) may change asynchronously while the output enable ( $\overline{\mathrm{OE}})$ is asserted low. This means that the device is driving status information on $\mathrm{DQ}_{7}$ at one instant and then that byte's valid data at the next instant of time. Depending on when the system samples the DQ7 output, it may read the status or valid data. Even if the device has completed the Embedded Algorithm operation and DQ ${ }_{7}$ has valid data, data outputs on $\mathrm{DQ}_{6}$ to $\mathrm{DQ}_{0}$ may be still invalid. The valid data on DQ7 to DQo will be read on successive read attempts.
The $\overline{\text { Data }}$ Polling feature is active only during the Embedded Programming Algorithm, Embedded Erase Algorithm or sector erase time-out. (See Table 10.)
See Figure 9 for the $\overline{\text { Data }}$ Polling timing specifications and diagrams.
DQ6
Toggle Bit I
The device also features the "Toggle Bit l" as a method to indicate to the host system that the Embedded Algorithms are in progress or completed.
During the Embedded Program or Erase Algorithm cycle, successive attempts to read ( $\overline{\mathrm{OE}}$ toggling) data from the device will result in DQ6 toggling between one and zero. Once the Embedded Program or Erase Algorithm cycle is completed, DQ6 will stop toggling and valid data will be read on the next successive attempts. During programming, the Toggle Bit I is valid after the rising edge of the fourth write pulse in the four write pulse sequence. For chip erase and sector erase, the Toggle Bit I is valid after the rising edge of the sixth write pulse in the six write pulse sequence. The Toggle Bit I is active during the sector time out.
In programming, if the sector being written is protected, the toggle bit will toggle for about $1 \mu$ s and then stop toggling with data unchanged. In erase, device will erase all selected sectors except for ones that are protected. If all selected sectors are protected, the chip will toggle the toggle bit for about $400 \mu$ s and then drop back into read mode, having data unchanged.

Either $\overline{\mathrm{CE}}$ or $\overline{\mathrm{OE}}$ toggling will cause $\mathrm{DQ}_{6}$ to toggle. In addition, an Erase Suspend/Resume command will cause DQ6 to toggle.

See Figure 10 and Figure 20 for the Toggle Bit I timing specifications and diagrams.

## MBM29PL3200TE/BE70990

## DQ5

## Exceeded Timing Limits

$\mathrm{DQ}_{5}$ will indicate if the program or erase time has exceeded the specified limits (internal pulse count). Under these conditions DQ5 will produce a "1". This is a failure condition which indicates that the program or erase cycle was not successfully completed. Data Polling is only operating function of device under this condition. The $\overline{\mathrm{CE}}$ circuit will partially power down the device under these conditions (to approximately 2 mA ). The $\overline{\mathrm{OE}}$ and $\overline{\mathrm{WE}}$ pins will control the output disable functions as described in Tables 2 and 3.

The DQ5 failure condition may also appear if a user tries to program a non-blank location without pre-erase. In this case the device locks out and never completes the Embedded Algorithm operation. Hence, the system never reads valid data on $\mathrm{DQ}_{7}$ bit and $\mathrm{DQ}_{6}$ never stops toggling. Once the device has exceeded timing limits, the $\mathrm{DQ}_{5}$ bit will indicate a "1." Please note that this is not a device failure condition since the device was incorrectly used. If this occurs, reset the device with the command sequence.
DQ3
Sector Erase Timer
After completion of the initial sector erase command sequence, sector erase time-out will begin. DQ3 will remain low until the time-out is completed. Data Polling and Toggle Bit are valid after the initial sector erase command sequence.

If $\overline{\text { Data }}$ Polling or the Toggle Bit I indicates that the device has been written with a valid erase command, $\mathrm{DQ}_{3}$ may be used to determine whether the sector erase timer window is still open. If $\mathrm{DQ}_{3}$ is high (" 1 "), the internally controlled erase cycle has begun; attempts to write subsequent commands to the device will be ignored until the erase operation is completed as indicated by Data Polling or Toggle Bit I. If DQ is low ("0"), the device will accept additional sector erase commands. To insure the command has been accepted, the system software should check the status of $\mathrm{DQ}_{3}$ prior to and following each subsequent Sector Erase command. If $\mathrm{DQ}_{3}$ is high on the second status check, the command may not have been accepted.

See Table 10 : Hardware Sequence Flags.

## DQ2

Toggle Bit II
This toggle bit II, along with $\mathrm{DQ}_{6}$, can be used to determine whether the device is in the Embedded Erase Algorithm or in Erase Suspend.

Successive reads from the erasing sector will cause DQ2 to toggle during the Embedded Erase Algorithm. If the device is in the erase-suspended-read mode, successive reads from the erase-suspended sector will cause DQ2 to toggle. When the device is in the erase-suspended-program mode, successive reads from the byte address of the non-erase suspended sector will indicate a logic "1" at the DQ2 bit.
$\mathrm{DQ}_{6}$ is different from $\mathrm{DQ}_{2}$ in that $\mathrm{DQ}_{6}$ toggles only when the standard program or Erase, or Erase Suspend Program operation is in progress. The behavior of these two status bits, along with that of $\mathrm{DQ}_{7}$, is summarized as follows :

For example, $\mathrm{DQ}_{2}$ and $\mathrm{DQ}_{6}$ can be used together to determine whether the erase-suspend-read mode is in progress. (DQ 2 toggles while $\mathrm{DQ}_{6}$ does not.) See also Table 11 and Figure 11.

Furthermore, $\mathrm{DQ}_{2}$ can also be used to determine which sector is being erased. When the device is in the erase mode, $\mathrm{DQ}_{2}$ toggles if this bit is read from an erasing sector.

## MBM29PL3200TE/BE70/90

## Reading Toggle Bits DQ6/DQ2

Whenever the system initially begins reading toggle bit status, it must read $\mathrm{DQ}_{7}$ to $\mathrm{DQ}_{0}$ at least twice in a row to determine whether a toggle bit is toggling. Typically, a system would note and store the value of the toggle bit after the first read. After the second read, the system would compare the new value of the toggle bit with the first. If the toggle bit is not toggling, the device has completed the program or erase operation. The system can read array data on $\mathrm{DQ}_{7}$ to $\mathrm{DQ}_{0}$ on the following read cycle.
However, if, after the initial two read cycles, the system determines that the toggle bit is still toggling, the system also should note whether the value of $\mathrm{DQ}_{5}$ is high (see the section on DQ5). If it is the system should then determine again whether the toggle bit is toggling, since the toggle bit may have stopped toggling just as DQ5 went high. If the toggle bit is no longer toggling, the device has successfully completed the program or erase operation. If it is still toggling, the device did not complete the operation successfully, and the system must write the reset command to return to reading array data.
The remaining scenario is that the system initially determines that the toggle bit is toggling and DQ5 has not gone high. The system may continue to monitor the toggle bit and DQ5 through successive read cycles, determining the status as described in the previous paragraph. Alternatively, it may choose to perform other system tasks. In this case, the system must start at the beginning of the algorithm when it returns to determine the status of the operation. (Refer to Figure 20.)

Table 11 Toggle Bit Status

| Mode | DQ $_{7}$ | $\mathbf{D Q}_{6}$ | $\mathbf{D Q}_{\mathbf{7}}$ |
| :--- | :---: | :---: | :---: |
| Program | $\overline{\mathrm{DQ}}_{7}$ | Toggle | 1 |
| Erase | 0 | Toggle | Toggle (Note) |
| Erase-Suspend Read <br> (Erase-Suspended Sector) | 1 | 1 | Toggle |
| Erase-Suspend Program | $\overline{\mathrm{DQ}}_{7}$ | Toggle | 1 (Note) |

Note : Successive reads from the erasing or erase-suspend sector will cause $\mathrm{DQ}_{2}$ to toggle. Reading from nonerase suspend sector address will indicate logic "1" at the DQ2 bit.

## Double Word/Word Configuration

DW $\bar{W}$ pin selects double word (32-bit) mode or word (16-bit) mode for the device. When this pin is driven high, the device operates in the double word (32-bit) mode. Data is read and programmed at $\mathrm{DQ}_{31}$ to $\mathrm{DQ}_{0}$. When this pin is driven low, the device operates in word (16-bit) mode. In this mode, the $\mathrm{DQ}_{31} / \mathrm{A}_{-1}$ pin becomes the lowest address bit, and $\mathrm{DQ}_{30}$ to $\mathrm{DQ}_{16}$ bits are tri-stated. However, the command bus cycle is always an 16-bit operation and hence commands are written at $\mathrm{DQ}_{31}$ to $\mathrm{DQ}_{16}$ and $\mathrm{DQ}_{15}$ to $\mathrm{DQ}_{0}$ bits are ignored. Refer to Figures 12,13 and 14 for the timing diagram.

## Data Protection

The device is designed to offer protection against accidental erasure or programming caused by spurious system level signals that may exist during power transitions. During power-up, the device automatically resets the internal state machine to Read mode. Also, with its control register architecture, alteration of memory contents only occurs after successful completion of the specific multi-bus cycle command sequence.
The device also incorporates several features to prevent inadvertent write cycles resulting from Vcc power-up and power-down transitions or system noise.

## MBM29PL3200TE/BE $70 / 90$

## Low Vcc Write Inhibit

To avoid initiation of a write cycle during $\mathrm{V}_{\text {cc }}$ power-up and power-down, a write cycle is locked out for $\mathrm{V}_{\mathrm{cc}}$ less than $\mathrm{V}_{\text {кко }}$ (Min.). If $\mathrm{V}_{\mathrm{cc}}<\mathrm{V}_{\text {Lко, }}$, the command register is disabled and all internal program/erase circuits are disabled. Under this condition, the device will reset to the read mode. Subsequent writes will be ignored until the $\mathrm{V}_{\mathrm{cc}}$ level is greater than VLko. It is the user's responsibility to ensure that the control pins are logically correct to prevent unintentional writes when $\mathrm{V}_{\mathrm{cc}}$ is above Vıко (Min.).
If the Embedded Erase Algorithm is interrupted, there is possibility that the erasing sector (s) can not be used.

## Write Pulse "Glitch" Protection

Noise pulses of less than 5 ns (typical) on $\overline{\mathrm{OE}}, \overline{\mathrm{CE}}$, or $\overline{\mathrm{WE}}$ will not initiate a write cycle.

## Logical Inhibit

Writing is inhibited by holding any one of $\overline{\mathrm{OE}}=\mathrm{V}_{\mathrm{I}}, \overline{\mathrm{CE}}=\mathrm{V}_{\mathrm{I}}$, or $\overline{\mathrm{WE}}=\mathrm{V}_{\boldsymbol{\prime}}$. To initiate a write cycle, $\overline{\mathrm{CE}}$ and $\overline{\mathrm{WE}}$ must be " $L$ " while $\overline{O E}$ is a logical one.

## Power-up Write Inhibit

Power-up of the device with $\overline{\mathrm{WE}}=\overline{\mathrm{CE}}=\mathrm{V}_{\mathrm{IL}}$ and $\overline{\mathrm{OE}}=\mathrm{V}_{\mathbb{H}}$ will not accept commands on the rising edge of $\overline{\mathrm{WE}}$. The internal state machine is automatically reset to read mode on power-up.

## MBM29PL3200TE/BE $70 / 90$

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Rating |  | Unit |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Max. |  |
| Storage Temperature | Tstg | -55 | +125 | ${ }^{\circ} \mathrm{C}$ |
| Ambient Temperature with Power Applied | Ta | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |
| Voltage with Respect to Ground All pins except A9, $\overline{O E}$, and ACC *1 | Vin, Vout | -0.5 | V cc +0.5 | V |
| Power Supply Voltage *1 | Vcc | -0.5 | +4.0 | V |
| As, $\overline{\mathrm{OE}}$, and ACC *2 | VIN | -0.5 | +13.0 | V |

*1: Minimum DC voltage on input or I/O pins is -0.5 V . During voltage transitions, input or I/O pins may undershoot V ss to -2.0 V for periods of up to 20 ns . Maximum DC voltage on input or I/O pins is $\mathrm{Vcc}+0.5 \mathrm{~V}$. During voltage transitions, input or I/O pins may overshoot to $\mathrm{Vcc}+2.0 \mathrm{~V}$ for periods of up to 20 ns.
*2: Minimum DC input voltage on $\mathrm{A}_{9}, \overline{\mathrm{OE}}$ and ACC pins is -0.5 V . During voltage transitions, $\mathrm{A}_{9}, \overline{\mathrm{OE}}$ and ACC pins may undershoot $\mathrm{V}_{\text {ss }}$ to -2.0 V for periods of up to 20 ns . Voltage difference between input and supply voltage $\left(\mathrm{V}_{\mathrm{I} ~}-\mathrm{V}_{\mathrm{cc}}\right.$ ) does not exceed 9.0 V. Maximum DC input voltage on $\mathrm{A}_{9}, \overline{\mathrm{OE}}$ and ACC pins is +13.0 V which may overshoot to 14.0 V for periods of up to 20 ns .
WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Part No. |  | Value |  |
| :---: | :---: | :--- | :---: | :---: | :---: |
|  |  |  |  |  |  |
| Ambient Temperature |  | Min. | Max. |  |  |
|  |  | MBM29PL3200TE/BE 70 | -20 | +70 | ${ }^{\circ} \mathrm{C}$ |
|  |  | MBM29PL3200TE/BE 90 | -40 | +85 |  |
| V Vcc | MBM29PL3200TE/BE 70 | +3.0 | +3.6 | V |  |
|  |  | MBM29PL3200TE/BE 90 | +2.7 |  |  |

Operating ranges define those limits between which the functionality of the device is quaranteed.
WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.
Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.
No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

|  | Min. | Typ. | Max. |  |  |
| Sector Erase Time | - | 4 | 40 | s | Excludes programming time prior to erasure |
| Word Programming Time | - | 14.3 | 360 | $\mu \mathrm{s}$ | Excludes system-level overhead |
| Double Word Programming Time | - | 18.3 | 480 |  |  |
| Chip Programming Time | - | 20 | 280 | s | Excludes system-level overhead |
| Erase/Program Cycle | 100,000 | - | - | cycle | - |

## PIN CAPACITANCE

| Parameter | Symbol | Condition | Value |  | Unit |
| :--- | :---: | :--- | :---: | :---: | :---: |
|  |  |  | Typ. | Max. |  |
| Input Capacitance | $\mathrm{C}_{\mathbb{N}}$ | $\mathrm{V}_{\mathbb{N}}=0$ | 6 | 7.5 | pF |
| Output Capacitance | $\mathrm{CouT}^{2}$ | $\mathrm{~V}_{\text {out }}=0$ | 8 | 10.0 | pF |
| Control Pin Capacitance | $\mathrm{C}_{\mathbb{N} 2}$ | $\mathrm{~V}_{\mathbb{N}}=0$ | 8 | 10.0 | pF |

Note : Test conditions $\mathrm{Ta}=25^{\circ} \mathrm{C}, \mathrm{f}=1.0 \mathrm{MHz}$

## FBGA PIN CAPACITANCE

| Parameter | Symbol | Condition | Value |  | Unit |
| :--- | :---: | :--- | :--- | :--- | :---: |
|  |  |  | Typ. | Max. |  |
| Input Capacitance | $\mathrm{C}_{\mathbb{N}}$ | $\mathrm{V}_{\mathbb{N}}=0$ | TBD | TBD | pF |
| Output Capacitance | $\mathrm{Cout}^{2}$ | $\mathrm{~V}_{\text {OUT }}=0$ | TBD | TBD | pF |
| Control Pin Capacitance | $\mathrm{C}_{\mathbb{N} 2}$ | $\mathrm{~V}_{\mathbb{N}}=0$ | TBD | TBD | pF |

Note : Test conditions $\mathrm{Ta}=25^{\circ} \mathrm{C}, \mathrm{f}=1.0 \mathrm{MHz}$

## MBM29PL3200TE/BE $70 / 90$

## SWITCHING WAVEFORMS

- Key to Switching Waveforms

| WAVEFORM | INPUTS | OUTPUTS |
| :---: | :---: | :---: |
|  | Must Be Steady | Will Be Steady |
| $9515$ | May Change from H to L | Will Be Change from H to L |
|  | May Change from L to H | Will Be Change from L to H |
|  | "H" or "L": <br> Any Change Permitted | Changing, State Unknown |
|  | Does Not Apply | Center Line is HighImpedance "Off" State |

Figure 5.1 Read Operation Timing Diagram

## MBM29PL3200TE/BE70/90

Figure 5.2 Page Read Operation Timing Diagram

## MBM29PL3200TE/BE70/90

Notes : 1.PA is address of the memory location to be programmed.
2.PD is data to be programmed at word address.
3. $\overline{D Q}_{7}$ is the output of the complement of the data written to the device.
4.Dout is the output of the data written to the device.
5. Figure indicates last two bus cycles out of four bus cycle sequence.

6 . These waveforms are for the $\times 32$ mode. (The addresses differ from $\times 16$ mode.)

Figure 6 Alternate $\overline{\text { WE }}$ Controlled Program Operation Timing Diagram

## MBM29PL3200TE/BE $70 / 90$

Notes: 1.PA is address of the memory location to be programmed.
2.PD is data to be programmed at word address.
$3 . \overline{D Q}_{7}$ is the output of the complement of the data written to the device.
4.Dout is the output of the data written to the device.
5. Figure indicates last two bus cycles out of four bus cycle sequence.
6. These waveforms are for the $\times 32$ mode. (The addresses differ from $\times 16$ mode.)

Figure 7 Alternate $\overline{\text { CE Controlled Program Operation Timing Diagram }}$

Note : 1.SA is the sector address for Sector Erase. Addresses $=555 \mathrm{~h}$ (Double Word), AAAh (Word) for Chip Erase.
2. These waveforms are for the $\times 32$ mode. (The addresses differ from $\times 16$ mode.)

## EMBEDDED ALGORITHM

Chip Erase Command Sequence* (Address/Command):

Individual Sector/Multiple Sector* Erase Command Sequence (Address/Command):

* : The sequence is applied for $\times 32$ mode. The addresses differ from $\times 16$ mode.

Figure 18 Embedded Erase ${ }^{\text {TM }}$ Algorithm

## MBM29PL3200TE/BE70/90

VA = Address for programming
= Any of the sector addresses within the sector being erased during sector erase or multiple erases operation.
= Any of the sector addresses within the sector not being protected during sector erase or multiple sector erases operation.
*: $\mathrm{DQ}_{7}$ should be rechecked even if $\mathrm{DQ}_{5}=$ " 1 " because $\mathrm{DQ}_{7}$ may change simultaneously with $\mathrm{DQ}_{5}$.
Figure $19 \overline{\text { Data }}$ Polling Algorithm

## MBM29PL3200TE/BE $70 / 90$

Notes: 1.Read toggle bit twice to determine whether or not it is toggling.
2.Recheck toggle bit because it may stop toggling as DQ5 changes to " 1 ".

Figure 20 Toggle Bit Algorithm

## MBM29PL3200TE/BE $70 / 90$

* : A-1 is VIl on word mode.

Figure 21 Sector Protection Algorithm

## MBM29PL3200TE/BE $70 / 90$

Notes : 1.All protected sectors are unprotected.
2.All previously protected sectors are protected once again.

## ORDERING INFORMATION

## Standard Products

Fujitsu standard products are available in several packages. The order number is formed by a combination of:

| Valid Combinations |  |  |
| :---: | :---: | :---: |
| MBM29PL3200TE/BE | 70 | PFV |
|  | 90 | PBT |

Valid Combinations
Valid Combinations list configurations planned to be supported in volume for this device. Consult the local Fujitsu sales office to confirm availability of specific valid combinations and to check on newly released combinations.

All Rights Reserved.
The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The contents of this document may not be reproduced or copied without the permission of FUJITSU LIMITED.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipments, industrial, communications, and measurement equipments, personal or household devices, etc.).

## CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
