

### PRODUCT OVERVIEW

The ADS-919 is a high-performance, 14-bit, 2MHz sampling A/D converter. This device accurately samples full-scale input signals up to Nyquist frequencies with no missing codes. The ADS-919 features outstanding dynamic performance including a THD of  $-74\text{dB}$ .

Housed in a small 24-pin DDIP or SMT (gull-wing) package, the functionally complete ADS-919 contains a fast-settling sample-hold amplifier, a sub-ranging (two-pass) A/D converter, a precise voltage reference, timing/control logic, and error correction circuitry. Digital input and output levels are TTL.

Requiring  $\pm 15\text{V}$  (or  $\pm 12\text{V}$ ) and  $+5\text{V}$  supplies, the ADS-919 typically dissipates  $1.8\text{W}$  ( $1.5\text{W}$  for  $\pm 12\text{V}$ ). The unit is offered with a unipolar input ( $0$  to  $+10\text{V}$ ). There are four models of the ADS-919 covering three operating temperature ranges,  $0$  to  $+70^\circ\text{C}$ ,  $-40$  to  $+85^\circ\text{C}$ ,  $-55$  to  $+125^\circ\text{C}$  and one high reliability "883" model is also available. All models are housed in the same ceramic package. Each model is available in Non-RoHS version or RoHS compliant ( $-C$ ) version. Applications include radar, sonar, spectrum analysis, and graphic/medical imaging.

### FEATURES

- 14-bit resolution
- 2MHz sampling rate
- No missing codes
- Functionally complete
- Small 24-pin DDIP or SMT package
- Low power, 1.8 Watts
- Operates from  $\pm 15\text{V}$  or  $\pm 12\text{V}$  supplies &  $+5\text{V}$  supply
- Edge-triggered; No pipeline delays
- Unipolar  $0$  to  $+10\text{V}$  input range

### INPUT/OUTPUT CONNECTIONS

PIN	FUNCTION	PIN	FUNCTION
1	BIT 14 (LSB)	24	$-12\text{V}/-15\text{V}$ SUPPLY
2	BIT 13	23	ANALOG GROUND
3	BIT 12	22	$+12\text{V}/+15\text{V}$ SUPPLY
4	BIT 11	21	$+10\text{V}$ REFERENCE OUT
5	BIT 10	20	ANALOG INPUT
6	BIT 9	19	ANALOG GROUND
7	BIT 8	18	BIT 1 (MSB)
8	BIT 7	17	BIT 2
9	BIT 6	16	START CONVERT
10	BIT 5	15	EOC
11	BIT 4	14	DIGITAL GROUND
12	BIT 3	13	$+5\text{V}$ SUPPLY

### Footnotes:

- ① All power supplies must be on before applying a start convert pulse. All supplies and the clock (START CONVERT) must be present during warmup periods. The device must be continuously converting during this time. There is a slight degradation in performance when using ±12V supplies.
- ② See Ordering Information for availability of ±5V input range. Contact DATEL for availability of other input voltage ranges.
- ③ A 2MHz clock with a 200ns wide start convert pulse is used for all production testing. See Timing Diagram for more details.

- ④ Effective bits is equal to:

$$(\text{SNR} + \text{Distortion}) - 1.76 + \left[ 20 \log \frac{\text{Full Scale Amplitude}}{\text{Actual Input Amplitude}} \right] \\ 6.02$$

- ⑤ This is the time required before the A/D output data is valid once the analog input is back within the specified range.

### TECHNICAL NOTES

1. Obtaining fully specified performance from the ADS-919 requires careful attention to pc-card layout and power supply decoupling. The device's analog and digital ground systems are connected to each other internally. For optimal performance, tie all ground pins (14, 19 and 23) directly to a large *analog* ground plane beneath the package.

Bypass all power supplies and the REFERENCE OUTPUT (pin 21) to ground with 4.7µF tantalum capacitors in parallel with 0.1µF ceramic capacitors. Locate the bypass capacitors as close to the unit as possible. If the user-installed offset and gain adjusting circuit shown in Figure 2 is used, also locate it as close to the ADS-919 as possible.

2. The ADS-919 achieves its specified accuracies without the need for external calibration. If required, the device's small initial offset and gain errors

can be reduced to zero using the input circuit of Figure 2. When using this circuit, or any similar offset and gain-calibration hardware, make adjustments following warmup. To avoid interaction, always adjust offset before gain.

3. When operating the ADS-919 from ±12V supplies, do not drive external circuitry with the REFERENCE OUTPUT. The reference's accuracy and drift specifications may not be met, and loading the circuit may cause accuracy errors within the converter.
4. Applying a start convert pulse while a conversion is in progress (EOC = logic "1") initiates a new and inaccurate conversion cycle. Data from the interrupted and subsequent conversions will be invalid.

### CALIBRATION PROCEDURE (Refer to Figures 2 and 3)

Any offset and/or gain calibration procedures should not be implemented until devices are fully warmed up. To avoid interaction, offset must be adjusted before gain. The ranges of adjustment for the circuit of Figure 2 are guaranteed to compensate for the ADS-919's initial accuracy errors and may not be able to compensate for additional system errors.

All fixed resistors in Figure 2 should be metal-film types, and multiturn potentiometers should have TCR's of 100ppm/°C or less to minimize drift with temperature.

A/D converters are calibrated by positioning their digital outputs exactly on the transition point between two adjacent digital output codes. This can be accomplished by connecting LED's to the digital outputs and adjusting until certain LED's "flicker" equally between on and off. Other approaches employ digital comparators or microcontrollers to detect when the outputs change from one code to the next.

For the ADS-919, offset adjusting is normally accomplished at the point where the output bits are 0's and the LSB just changes from a 0 to a 1. This digital output transition ideally occurs when the applied analog input is  $+\frac{1}{2}$  LSB ( $+305\mu\text{V}$ ).

Figure 2. ADS-919 Calibration Circuit

Gain adjusting is accomplished when all bits are 1's and the LSB just changes from a 1 to a 0. This transition ideally occurs when the analog input is at +full scale minus  $1\frac{1}{2}$  LSB's ( $+9.999085\text{V}$ ).

### Zero/Offset Adjust Procedure

1. Apply a train of pulses to the START CONVERT input (pin 16) so the converter is continuously converting. If using LED's on the outputs, a 200kHz conversion rate will reduce flicker.
2. Apply  $+305\mu\text{V}$  to the ANALOG INPUT (pin 20).
3. Adjust the offset potentiometer until the output bits are all 0's and the LSB flickers between 0 and 1.

### Gain Adjust Procedure

1. Apply  $+9.999085\text{V}$  to the ANALOG INPUT (pin 20).
2. Adjust the gain potentiometer until the output bits are all 1's and the LSB flickers between 1 and 0.

Table 1. Zero and Gain Adjust

INPUT VOLTAGE RANGE	ZERO ADJUST $+\frac{1}{2}$ LSB	GAIN ADJUST $+FS -1\frac{1}{2}$ LSB
0 to $+10\text{V}$	$+305\mu\text{V}$	$+9.999085\text{V}$

Table 2. Output Coding

INPUT VOLTAGE (0 TO $+10\text{V}$ )	UNIPOLAR SCALE	DIGITAL OUTPUT	
		OFFSET MSB	BINARY LSB
$+9.999390$	$+FS -1\text{LSB}$	11 1111 1111 1111	
$+7.500000$	$+3/4 FS$	11 0000 0000 0000	
$+5.000000$	$+1/2 FS$	10 0000 0000 0000	
$+2.500000$	$+1/4 FS$	01 0000 0000 0000	
$+0.000610$	$+1\text{LSB}$	00 0000 0000 0001	
$0.000000$	0	00 0000 0000 0000	

Coding is straight binary; 1LSB =  $610\mu\text{V}$ .

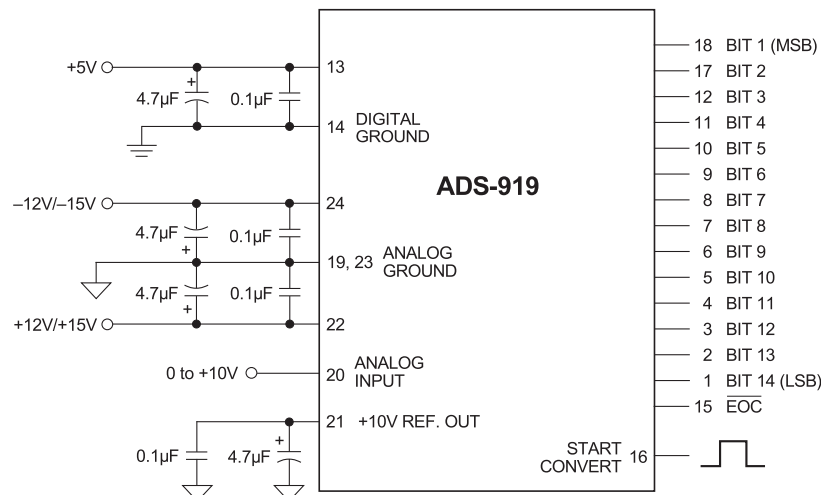

Figure 3. Typical ADS-919 Connection Diagram

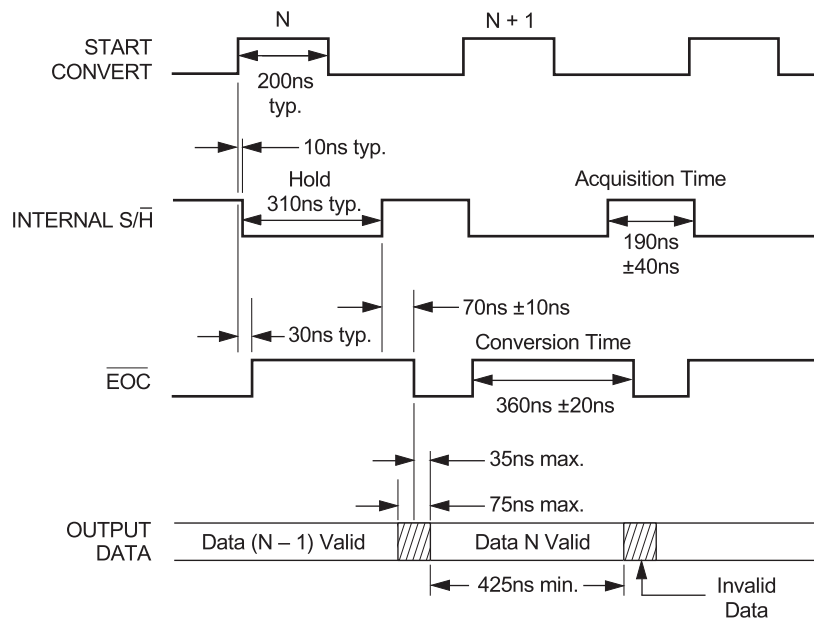

## THERMAL REQUIREMENTS

All DATEL sampling A/D converters are fully characterized and specified over operating temperature (case) ranges of 0 to +70°C and -55 to +125°C. All room-temperature ( $T_A = +25^\circ\text{C}$ ) production testing is performed without the use of heat sinks or forced-air cooling. Thermal impedance figures for each device are listed in their respective specification tables.

These devices do not normally require heat sinks, however, standard precautionary design and layout procedures should be used to ensure

devices do not overheat. The ground and power planes beneath the package, as well as all pcb signal runs to and from the device, should be as heavy as possible to help conduct heat away from the package.

Electrically-insulating, thermally-conductive "pads" may be installed underneath the package. Devices should be soldered to boards rather than "socketed," and of course, minimal air flow over the surface can greatly help reduce the package temperature.

Notes: 1.  $f_s = 2\text{MHz}$ .

- The ADS-919 is an edge-triggered device. All internal operations are triggered by the rising edge of the start convert pulse, which may be as narrow as 20nsec. All production testing is performed at a 2MHz sampling rate with 200nsec wide start pulses. For lower sampling rates, wider start pulses may be used, however, a minimum pulse width low of 20nsec must be maintained.
