

460EX

PowerPC 460EX Embedded Processor

Preliminary Data Sheet

Features

- PowerPC® 440 processor operating between 600MHz and 1.000GHz with 32KB I-cache and D-cache and 256KB L2/SRAM with parity checking
- On-chip memory (64KB)
- Floating Point Unit
- Processor Local Bus (PLB) with 128-bit width
- Double Data Rate 2/1 (DDR2/1) Synchronous DRAM (SDRAM) interface
- One four-channel DMA (Direct Memory Access) for internal and external peripherals
- One single-channel, high-performance DMA for internal use
- External 32-bit peripheral bus (EBC) for up to six devices. Up to 100MHz
- Programmable Interrupt Controller (UIC) with up to 16 external interrupts
- Programmable General Purpose Timers (GPTs)
- Two PCI Express 1.1 interfaces—one 4-lane and one 1-lane
- PCI V2.3 interface. Thirty-two bits at up to 66MHz
- Two Ethernet 10/100/1000Mbps half- or full-duplex interfaces. Operational modes supported are MII, GMII, RGMII, and SGMII with QoS, Jumbo frames, interrupt coalescing, and TCP/IP acceleration
- Up to four serial (UART) ports (16750 compatible)
- USB 2.0 Host/Device OTG and Host interface
- Two IIC interfaces (one with boot parameter read capability)
- NAND Flash interface
- SPI interface
- SATA controller
- General Purpose I/O (GPIO) interface
- JTAG interface for board level testing
- Boot from PCI memory, NOR Flash on the external peripheral bus, or NAND Flash on the NAND Flash interface
- Optional security feature with KASUMI
- Available in RoHS compliant, lead-free package

Description

Designed specifically to address high-end embedded applications, the PowerPC 460EX (PPC460EX) provides a high-performance, low-power solution that interfaces to a wide range of peripherals and incorporates on-chip power management features.

This chip contains a high-performance RISC processor, on-chip memory, a floating point unit, a DDR2/1 SDRAM controller, PCI and PCI Express bus interfaces, control for external ROM and peripherals, DMA with scatter/gather support, Ethernet ports, serial ports, IIC interfaces, SPI interface, USB ports, NAND Flash interface, SATA interface, an optional security feature with KASUMI, and general purpose I/O.

Technology: CMOS Cu-08, 90nm.

Package: 35mm, 728-ball thermally and electrically enhanced plastic ball grid array (TE-EPBGA). RoHS compliant package available.

Typical power: Less than 5W at 1 GHz with DDR2.

Supply voltages required: 3.3V, 2.5V (DDR1, Ethernet), 1.8V (DDR2), 1.2V.

Preliminary Data Sheet**Ordering and PVR Information**

For information on the availability of the following parts, contact your local AMCC sales office. For additional information on the part number structure see *Figure 1*.

Product Name	Order Part Number (see Notes)	Package	Revision Level	PVR Value	JTAG ID
PPC460EX	PPC460EX-opAfff(f)T	35mm 728-ball TE-EPBGA	A	0x130218A2	0x144101E1
PPC460EX	PPC460EX-opBfff(f)T	35mm 728-ball TE-EPBGA	B	0x130218A4	0x144101E1

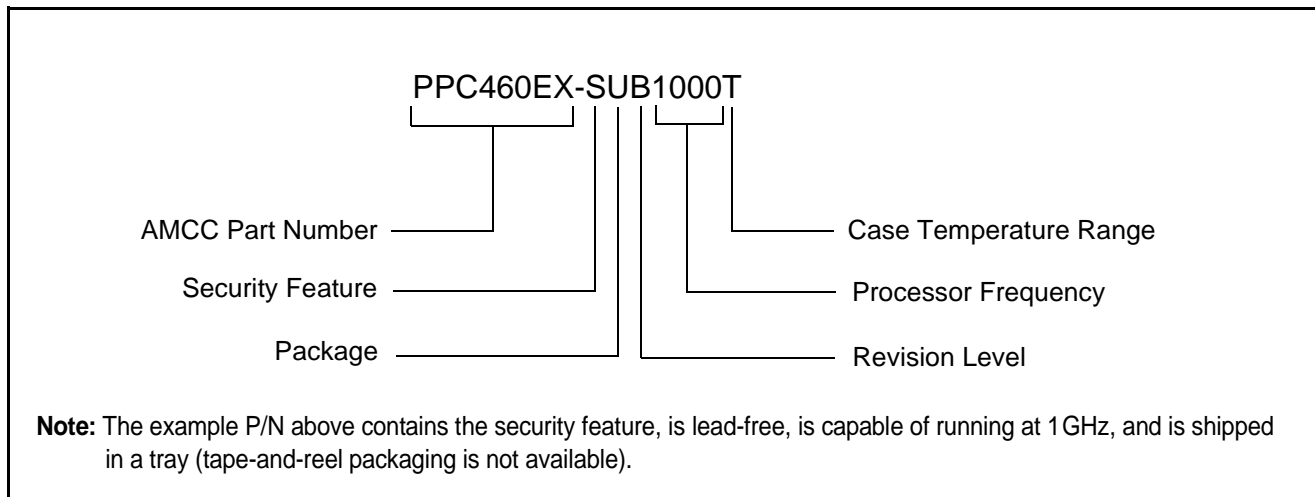

Notes: Characters following the dash (-):

- o = Security option: S = security feature present, N = no security
- p = Package type: U = lead-free (RoHS compliant), T = contains lead.
- A = Chip revision level A, B = Chip revision level B
- fff(f) = Processor frequency: fff = 600 = 600MHz, fff = 800 = 800MHz, fff = 1000 = 1GHz
- T = Case temperature range of -40°C to +85°C.

Each part number contains a revision code. This is the die mask revision number and is included in the part number for identification purposes only.

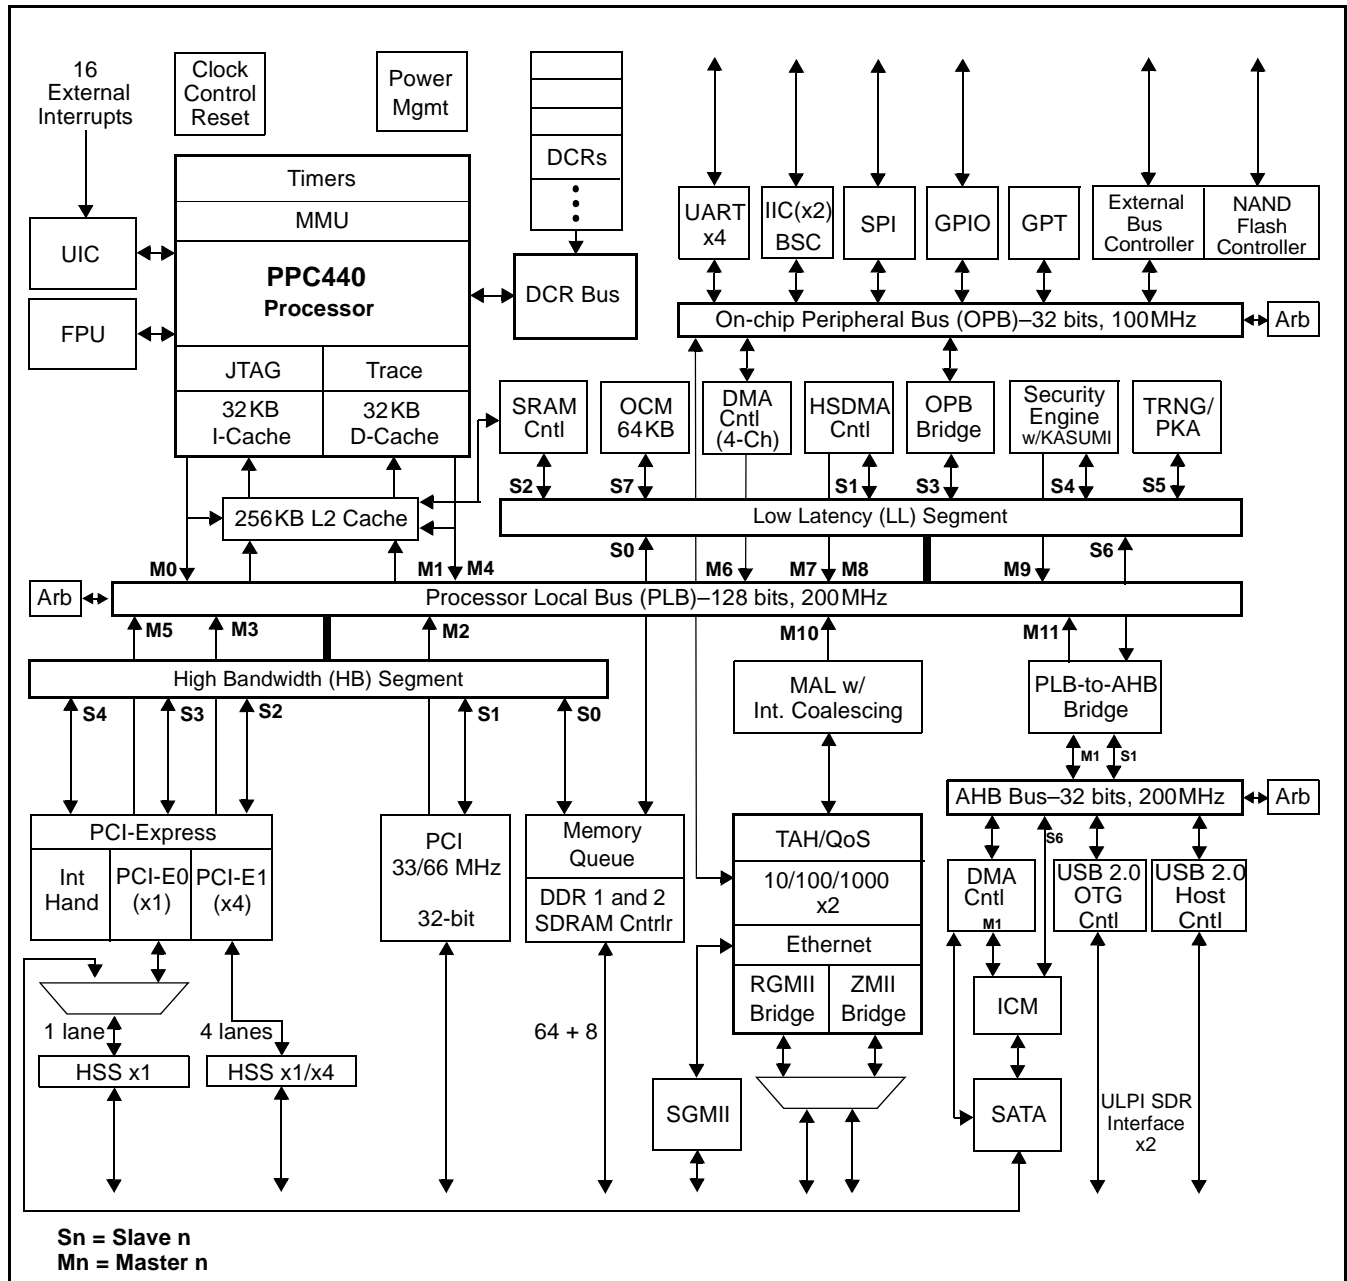

The PVR (Processor Version Register) and the JTAG ID register are software accessible (read-only) and contain information that uniquely identifies the part. Refer to the *PowerPC 460EX/EXr/GT Embedded Processor User's Manual* for details on accessing these registers.

Block Diagram

Figure 2. PPC460EX Functional Block Diagram

The PPC460EX is a system on a chip (SOC).

Preliminary Data Sheet**Address Maps**

The PPC460EX incorporates two address maps. The first is a fixed processor System Memory Address Map. This address map defines the possible contents of various address regions which the processor can access. The second is the DCR Address Map for Device Configuration Registers (DCRs). The DCRs are accessed by software running on the PPC460EX processor through the use of **mtdcr** and **mfdcr** instructions.

PCI/PCIE Space (HB)	PCI, PCI Express Memory	2000 0000 0000 0000	FFFF FFFF FFFF FFFF	

Notes:

1. DDR SDRAM, SRAM (L2 Cache) and On-Chip Memory (OCM) can be located anywhere in the Local Memory area of the memory map.
2. The Boot ROM area of the memory map are intended for use by ROM or Flash-type devices. While locating volatile DDR SDRAM and SRAM in this region is supported, use of these regions for this purpose is not recommended.
3. When the optional boot from PCI Memory is selected, the PCI Boot ROM address space begins at 0000 000C FF00 0000 (16 MB).
4. Never decoded.
5. Unpredictable results on Read and Write operations.
6. Accessed by means of EBC Peripheral Bank Configuration Registers.

Notes:

- DCR addresses are 10 bits (1024 or 1K unique addresses). Each unique address represents a single 32-bit (word) register. One kiloword (1024W) equals 4KB (4096 B).

Preliminary Data Sheet**PPC460EX Features**

The following sections provide information on the features of the chip.

PowerPC 440 Processor

The PowerPC 440 processor (in 90nm technology) is designed for high-end applications: RAID controllers, SAN, iSCSI, routers, switches, printers, set-top boxes, etc. It implements the Book E PowerPC embedded architecture and uses the 128-bit version of IBM's on-chip CoreConnect Bus Architecture.

Features include:

- Up to 1.000GHz operation
- PowerPC Book E architecture
- 32KB I-cache, 32KB D-cache
 - UTLB Word Wide parity on data and tag address parity with exception force
- Three logical regions in D-cache: locked, transient, normal
- D-cache full line flush capability
- 41-bit virtual address, 36-bit (64GB) physical address
- Superscalar, out-of-order execution
- 7-stage pipeline
- Three execution pipelines
- Dynamic branch prediction
- Memory management unit
 - 64-entry, full associative, unified TLB with optional parity
 - Separate instruction and data micro-TLBs
 - Storage attributes for write-through, cache-inhibited, guarded, and big or little endian
- Debug facilities
 - Multiple instruction and data range breakpoints
 - Data value compare
 - Single step, branch, and trap events
 - Non-invasive real-time trace interface
- 24 DSP instructions
 - Single cycle multiply and multiply-accumulate
 - 32 x 32 integer multiply
 - 16 x 16 -> 32-bit MAC

Floating Point Unit (FPU)

The chip has a built-in super scalar FPU that supports both single- and double-precision operations, and offers single cycle through put on most instructions.

Features include:

- Five stages with 2 MFlops/MHz
- Hardware support for IEEE 754
- Single- and double-precision
- Single-cycle throughput on most instructions
- Thirty-two 64-bit floating point registers

L2 Cache/SRAM

The PPC460EX also provides a 256KB L2 cache between the Processor Local Bus and the processor's D- and I-caches. This memory unit can be alternatively programmed to function as 256KB of SRAM.

Features include:

- Four banks of 64KB each
- Memory cycles supported:
 - Single beat read and write, 1 to 16 bytes
 - Quadword Read and Write burst for 12-bit master
 - Guarded memory accesses on 4KB boundaries
- Sustainable 3.2GB/s peak bandwidth at 200MHz
- Use as an L2 cache improves processor performance and reduces the PLB load
 - Cache coherency maintained by a hardware snoop mechanism on the Low Latency (LL) Processor Local Bus (PLB) or by software
 - Data Array and Tag Array parity
 - Unified data and instruction cache
 - Four-way set associative
 - 36-bit addressing
 - Full LRU replacement algorithm
 - Write through, look aside

On-Chip Memory (OCM)

The PPC460EX provides 64KB of on-chip memory.

Features include:

- Up to 128-bit bus width
- 128-bit slave attachment, addressable by any PLB master
- Transfers by PLB slave cycles:
 - Single-beat read and write (1 to 8 bytes for 64-bit masters, 1 to 16 bytes for 128-bit masters)
 - 4- and 8-word line reads and writes
 - Double word read and write bursts for 64-bit masters
 - Quadword read and write bursts for 128-bit masters
 - Slave-terminated double word and quadword fixed length bursts
 - Master-terminated variable length bursts
- Guarded memory access on 4KB boundaries
- Data parity checking
- Data transfers at PLB bus speeds
- Power management
- Use as storage area for DMA descriptors and packet data for processing by Ethernet and Security Function.

Internal Buses

The PowerPC 460EX features four standard internal buses: one Processor Local Bus (PLB), one On-chip Peripheral Bus (OPB), the Advanced High-performance Bus (AHB), and the Device Control Register bus (DCR). The high performance, high bandwidth functions such as the PowerPC 440 processor, the DDR SDRAM memory controller, PCI Express, PCI, and the AHB bridge, connect to the PLB. The OPB hosts lower data rate peripherals. The daisy-chained DCR provides a lower bandwidth path for passing status and control information between the processor and the other on-chip cores.

The PLB has a Crossbar arbiter that supports data transfer between the PLB master and two slave segments identified as the Low Latency (LL) and High Bandwidth (HB) segments. The LL segment allows PLB masters CPU and I2O, that are adversely affected by latency, to communicate with slave devices with minimal latency. The HB segment allows PLB masters DMA, PCI and PCI Express to exchange large blocks of data with SDRAM, PCI and PCI Express without interfering with the low latency PLB masters.

Preliminary Data Sheet

Features include:

- PLB4 (128-bit)
 - 128-bit implementation of the PLB architecture
 - Separate and simultaneous read and write data paths
 - 64-bit address
 - Simultaneous control, address, and data phases
 - Four levels of pipelining
 - Byte-enable capability supporting unaligned transfers
 - 32- and 64-byte burst transfers
 - 200MHz, maximum 12.8GB/s (simultaneous read and write)
 - Processor:bus clock ratios of N:1
- AHB
 - 32-bit data path
 - 32-bit address
 - Synchronous to the PLB
 - Up to 200MHz, maximum 800MB/s
- OPB
 - 32-bit data path with dynamic sizing for 32-, 16-, and 8-bit width
 - 32-bit address
 - 100MHz
- DCR
 - 32-bit data path
 - 10-bit address

Security Function (Optional)

The built-in security function is a cryptographic engine attached to the PLB with built-in DMA and interrupt controllers.

Features include:

- Federal Information Processing Standard (FIPS) 140-2 design
- Support for an unlimited number of Security Associations (SA)
- Different SA formats for each supported protocol (IPsec/SSL/TLS/sRTP)
- Internet Protocol Security (IPSec) features
 - Full packet transforms, Encapsulated Security Payload (ESP) and Authentication Header (AH)
 - Complete header and trailer processing (IPv4 and IPv6)
 - Multi-mode automatic padding
 - "Mutable bit" handler for AH, including IPv4 option and IPv6 extension headers
 - Extended Sequence Number (ESN) processing for ESP and AH
- Secure Socket Layer (SSL) and Transport Layer Security (TLS) features and Datagram Transport Layer Security (DTLS) features
 - Packet transforms
 - One-pass hash-then-encrypt for SSL and TLS packet transforms for inbound packet using Stream Cipher
- Secure Real-Time Protocol (sRTP) features
 - Packet transforms
 - Roll Over Counter (ROC) removal and TAG insertion
 - Variable bypass offset of header length per packet
- Media Access Control Security (MACSec) features
 - MSDU (User data) encryption 0, 30, or 50 bytes offset
 - Header insertion and removal
 - SecTAG header with or without Secure Channel Identifier (SCI) field
 - 128-bit key, 96-bit IV (nonce) and 128-bit ICV
 - IV from SA record or from input buffer (as part of SecTAG)
 - ICV generation and validation

- SGT features:
 - GCM-AES with 128-bit key, 96-bit IV (nonce) and 128-bit ICV
 - SecTAG header with or without Secure Channel Identifier (SCI) field
 - Replay protection "Strict order Mode" and "Out of Order Mode"
 - Header insertion and removal
 - ICV generation and validation
- IPsec/SSL security acceleration engine
- DES, 3DES, AES, ARC-4 encryption (no support for hashing of zero length messages)
- MD-5, SHA-1, and SHA-2 (224-, 256-, 384-, and 512-bit) hashing, HMAC encrypt-hash and hash-decrypt
- Public key acceleration (PKA) for RSA, DSA and Diffie-Hellman
- True (TRNG) or pseudo (PRNG) random number generators
 - Non-deterministic true random numbers
 - Pseudo random numbers with lengths of 8 or 16 bytes
 - ANSI X9.17 Annex C compliant using a DES algorithm
- Interrupt controller
 - Fifteen programmable, maskable interrupts
 - Initiate commands by means of an input interrupt
 - Sixteen programmable interrupts indicating completion of certain operations
 - All interrupts mapped to one level- or edge-sensitive programmable interrupt output
- DMA controller
 - Autonomous, 4-channel
 - 1024 words (32 bits/word) per DMA transfer
 - Scatter/gather capability with byte aligned addressing

PCI Controller

The PCI interface allows connection of PCI devices to the PowerPC processor and local memory. This interface is designed to Version 2.3 of the PCI Specification and supports 32-bit PCI devices.

Reference Specifications:

- PCI Specification Version 2.3
- PCI Bus Power Management Interface Specification Version 1.1

Features include:

- Frequency to 66MHz
- 32-bit bus
- PCI Host Bus Bridge or an Adapter Device's PCI interface
- Internal PCI arbitration function, supporting up to four external devices, that can be disabled for use with an external arbiter
- Support for inbound and outbound Message Signaled Interrupts (MSI)
- Simple message passing capability
- Asynchronous to the PLB
- PCI Power Management 1.1
- PCI register set addressable both from on-chip processor and PCI device sides
- Ability to boot from PCI bus memory
- Error tracking/status
- Supports initiation of transfers of the following types:
 - Single beat I/O reads and writes
 - Single beat and burst memory reads and writes
 - Single beat configuration reads and writes (type 0 and type 1)
 - Single beat special cycles
- Vital Product Data (VPD) support

Preliminary Data Sheet**PCI Express Controller**

There are two independent PCI Express interfaces compliant with PCI Express base specification 1.1. One interface can be configured as one to four lanes while the other functions as one-lane only. Both can be Root or Endpoint Ports. The single lane interface shares a High-Speed SERDES with the Serial ATA (SATA) interface.

Features include:

- Two independent PCI Express interfaces
 - One 4 lanes
 - One 1 lane
 - 2.5 GB/sec full duplex per lane
- Compliant with PCI Express base specification 1.1
- Each PCI Express port can be End Point or Root Complex. (Upstream & Downstream)
 - Applications compliant with MSI rules are limited to one Endpoint port per PPC460EX
- Power Management
- Supports one virtual channel (VC0) no Traffic Class (TC) filtering
- Maximum Payload block size 512 Bytes
- Supports up to 512 Bytes maximum Read request size
- Requests supported:
 - up to 4 (x4) or 2 (x1) posted outbound Write requests (memory and messages)
 - up to 4 (x4) or 2 (x1) posted inbound Write requests
 - up to 4 (x4) or 2 (x1) outbound Read requests outstanding on PCI Express
 - up to 4 (x4) or 2 (x1) inbound Read requests outstanding on PCI Express
 - Outbound I/O request as a PCI Express Root Port
 - Inbound I/O request as a PCI Express Endpoint
- Buffering in each PCI Express port for the following transaction types:
 - 2KB Replay buffer: up to 4 in flight transactions
 - 2KB (x4) or 1KB (x1) for Outbound posted Writes
 - 2KB (x4) or 1KB (x1) for Outbound Reads completion
 - 2KB (x4) or 1KB (x1) for Inbound posted Writes
 - 2KB (x4) or 1KB (x1) for Inbound Reads completion
- Parity checking on each buffer
- Programmable Outbound Memory (POM) regions: 3 memory, 1 I/O, 1 message, 1 configuration, 1 internal register
- Programmable Inbound Memory (PIM) regions: 4 memory, 1 I/O, 1 expansion ROM
- INTx Interrupts support (legacy PCI):
 - Up to four INTx Termination for Root Ports. A/B/C/D interrupts are wired to the UIC
 - A/B/C/D INTx types generation for Endpoints
- MSI - Message Signaled Interrupts
 - MSI generation for Endpoint
 - MSI termination for Root Ports
 - MSI_X termination for Root Ports

DDR2/1 SDRAM Memory Controller

The Double Data Rate 2/1 (DDR2/1) SDRAM memory controller supports industry standard 184-pin DIMMs, SO-DIMMs, and other discrete devices. Global memory timings, address and bank sizes, and memory addressing modes are programmable. This controller interfaces to the PLB through a Memory Queue (MQ) function that includes six high-speed 1 KB FIFO buffers.

The correct I/O supply voltage must be provided for the two types of DDR devices: DDR1 devices require +2.5V and DDR2 devices require +1.8V.

Features include:

- Registered and non-registered industry standard DIMMs
- DDR2 333/400 support
- 64- and 32-bit memory interfaces with optional 8-bit ECC (SEC/DED)
- 3.2GB/s peak bandwidth for the 64-bit interface
- 1.6GB/s peak bandwidth for the 32-bit interface
- Four chip (bank) select signals supporting four external banks
- CAS latencies of 2, 3, 4, 5, 6, and 7
- Page mode accesses (up to 32 open pages) with configurable paging policy
- Look-ahead request queue with programmable depth of four commands
- Optional optimized command scheduling (activate/precharge non-conflicting banks while accessing the current bank)
- Up to 8GB in four external banks
- Up to two MemClkOut signals
- Programmable address mapping and timing
- Hardware and software initiated self-refresh
- Sync DRAM configuration by means of mode register and extended mode register set commands
- Power management (self-refresh, suspend, sleep)
- Low Latency and High Bandwidth PLB ports
- Selectable PLB read response (immediate or deferred)
- Programmable Low Latency and High Bandwidth arbitration schemes
- High Bandwidth port has four 1 KB read buffers and two 1 KB write buffers
- Low Latency port has four 128B read buffers and two 128B write buffers

Preliminary Data Sheet**External Peripheral Bus Controller (EBC)**

The External Bus Controller (EBC) transfers data between the PLB and external memory or peripheral devices attached to the external peripheral bus. The EBC allows for direct attachment of memory devices such as ROM and SRAM, DMA device-paced memory devices, and DMA peripheral devices.

Features include:

- Up to six ROM, EPROM, SRAM, Flash memory, and slave peripheral I/O banks supported
- Up to 100MHz operation
- Burst and non-burst devices
- 32-bit byte-addressable data bus
- Data parity
- 27-bit address
- Peripheral Device pacing with external Ready
- Latch data on Ready, synchronous or asynchronous
- Programmable access timing per device
 - 256 Wait States for non-burst
 - 32 Burst Wait States for first access and up to eight Wait States for subsequent accesses
 - Programmable C_{son}, C_{soff} relative to address
 - Programmable OE_{on}, WE_{on}, WE_{off} (1 to 4 clock cycles) relative to CS
- Programmable address mapping
- External DMA Slave Support

Ethernet Controller

Two 10/100/1000 Ethernet ports are supported.

Features include:

- Compliant with ANSI/IEEE Standard 802.3 and IEEE 802.3u supplement
- Compliant with IEEE Standard 802.3z (Gigabit Ethernet)
- Two 10/100/1000 interfaces running in full- and half-duplex modes providing:
 - One Gigabit Media Independent Interface (GMII)
 - One Media Independent Interface (MII)
 - Two Reduced Gigabit MII (RGMII)
 - Two Serial GMIIs (SGMII)
- Quality of Service (QoS) support
 - Support of IEEE 802.1p priority queueing for up to 8 priorities
 - Recognizes TCI field in VLAN-tagged frames where the priority field is coded
- Jumbo frame support (9018 bytes)
 - Support for Ethernet II formatted frames (RFC894)
 - Support for IEEE formatted frames (RFC1042)
 - Handles VLAN-tagged frames (IEEE 802.2ac)
- TCP/IP Acceleration Hardware (TAH) support
 - Off loads Gigabit Ethernet protocol processing from the CPU
 - Checksum verification for TCP/UDP/IP headers in the receive path
 - Checksum generation for TCP/UDP/IP headers in the transmit path
 - TCP segmentation support in the transmit path
 - IPv4 and IPv6 support
 - IPv6 header extension support
- Wake On LAN handling
- 256-bit hash table to filter multicast frames
- DMA capability
- Interrupt coalescence

DMA 4-Channel Controller

The 4-channel DMA controller provides a DMA interface between the PLB memories and internal and external peripheral devices.

Features include:

- Supports the following transfers:
 - Memory-to-memory
 - Buffered peripheral to memory
 - Buffered memory to peripheral
- Scatter/Gather capability for programming multiple DMA operations
- 8-, 16-, 32-bit peripheral support (OPB and external)
- 64-bit addressing
- 128 byte FIFO buffer
- Address increment or decrement
- Support for:
 - Internal and external peripherals
 - Memory mapped peripherals
 - Peripherals running on slower frequency buses

I2O/DMA Controller

The I2O/DMA controller provides one High Speed DMA (HSDMA) interface to the PLB and support for I2O messaging. The HSDMA provides single-channel direct memory access support to ease the CPU burden. I2O manages Message Frame Address (MFA) FIFOs or queues in memory in response to I2O register reads and writes and transfers message frames.

DMA features include:

- Programmable Command Pointer FIFO and Completion FIFO size (up to 2048 DMA operations queued)
- Separate 512-byte buffering for transmit and receive
 - 1.4GB throughput (local read)
 - 1.0GB throughput (remote read)
- Simultaneous fill and drain (PLB read/write pipelining)
- Any source PLB address to any destination address
- No memory alignment restrictions on source or destination
- 32-byte command descriptor block
- Maximum transfer size of 16MB
- 64-bit addressing
- Prefetch indicators for PCI buffer management
- Supports initiation of transfer to the following address spaces:
 - Single beat I/O reads and writes
 - Single beat and burst memory reads and writes
 - Single beat configuration reads and writes (type 0 and type 1)
 - Single beat special cycles

I2O features include:

- I2O pull- and push-messaging methods
- Dynamic message frame size
- Programmable FIFO size (4096 64-bit MFAs maximum)
- 64- and 32-bit MFA sizes
- Three interrupt gathering methods
- Registered MFA prefetch and posting
- 32-bit inbound and outbound doorbell registers
- Four 32-bit scratch pad registers

Preliminary Data Sheet**Serial Ports (UART)**

The Universal Asynchronous Receiver/Transmitter (UART) interface provides one 8-signal port, or two 4-signal ports, or four 2-signal ports. The UART performs serial-to-parallel conversion on data received from a peripheral device or a modem, and parallel-to-serial conversion on data received from the processor.

Features include:

- Up to four ports in the following combinations:
 - One 8-pin (UART0)
 - Two 4-pin (UART0 and UART1)
 - Four 2-pin (UART0, UART1, UART2, and UART3)
- Selectable internal or external serial clock to allow wide range of baud rates
- Register compatibility with 16750 register set
- Complete status reporting capability
- Fully programmable serial-interface characteristics
- Supports DMA using the 4-channel internal DMA function
- 64-byte FIFOs for buffering transmit and receive data

IIC Bus Controller

The Inter-Integrated Circuit (IIC) interface provides a Philips® I²C™ compatible interface operating up to 400 kHz either as a master, a slave, or both, with a Bootstrap Controller (BSC) included. During chip reset, the Bootstrap Controller can read configuration data from an IIC-compatible memory device (for example, EEPROM). This data can be used to replace the default configuration settings provided by the chip.

Features include:

- Two IIC interfaces
- Support for Philips Semiconductors I²C Specification, dated 1995
- Operation at 100kHz or 400kHz
- 8-bit data
- 10- or 7-bit address
- Slave transmitter and receiver
- Master transmitter and receiver
- Multiple bus masters
- Supports fixed V_{DD} IIC interface
- Two independent 4 x 1 byte data buffers
- Twelve memory-mapped, fully programmable configuration registers
- One programmable interrupt request signal
- Provides full management of all IIC bus protocols
- Programmable error recovery
- Port 0 includes an integrated BSC that supports a serial Bootstrap ROM with default override parameters at initialization

Serial Peripheral Controller (SPI/SCP)

The Serial Peripheral Interface (also known as the Serial Communications Port) is a full-duplex, synchronous, character-oriented (byte) port that allows the exchange of data with other serial devices. The SPI is a master on the serial port supporting a 3-wire interface (receive, transmit, and clock), and is a slave on the OPB.

Features include:

- Three-wire serial port interface
- Full-duplex synchronous operation
- SPI bus master
- OPB bus slave
- Programmable clock rate divider
- Clock inversion
- Reverse data
- Local data loop back for test

Universal Serial Bus 2.0 (USB)

Two USB 2.0 interfaces provide both Device and Host support. These interfaces are provided as one USB 2.0 On-The-Go (OTG) controller (Host and Device) and one USB 2.0 Host controller. Both controllers provide support to an external PHY device through separate ULPI SDR interfaces.

Features include:

- USB 2.0 Host
 - Fully compliant to the following specifications:
 - Universal Serial Bus Specification, Revision 2.0
 - Enhanced Host Controller Interface (EHCI) Specification for USB, Revision 1.0
 - Open Host Controller Interface (OHCI) Specification for USB, Revision 1.0a
 - One EHCI high speed (480Mbps) Host interface
 - One OHCI full/low speed (12Mbps/1.5Mbps) Host interface
 - Maximum packet sizes of 1024B for isochronous transfers and 512B for bulk transfers
 - Isochronous traffic can have three packets per microframe (196.6 Mbps throughput)
 - Data and descriptor prefetch to optimize performance and off load CPU
 - 4 KB buffer
- USB 2.0 OTG
 - Fully compliant to the following specifications
 - Universal Serial Bus Specification, Revision 2.0
 - On-The-Go Supplement to the USB 2.0 Specification, Revision 1.0a
 - Configurable as a Host-only or Device-only controller
 - Supports high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfers
 - Maximum packet sizes of 1024B for isochronous transfers and 512B for bulk transfers
 - Isochronous traffic can have three packets per microframe (196.6 Mbps throughput)
 - Integrated DMA support to optimize performance and off load CPU
 - Device support provides six Endpoints (3 IN, 3 OUT)
 - 8192-byte FIFO by Endpoint (supports high-bandwidth isochronous transfers, double buffering of 1024-byte packets)
 - FIFOs are not shared between IN and OUT Endpoints
 - Two USB 2.0 device Endpoints have DMA dedicated channels
 - 16KB buffer

Preliminary Data Sheet**Serial ATA (SATA)**

The Serial Advanced Technology Attachment (ATA) interface provides an interface to physical storage devices. It shares the High-Speed SERDES with the PCI-Express interface with 1-Lane.

Features include:

- Compliant with Serial ATA Revision 2.5 Specification
- Supports SATA 1.5Gbps Generation 1 and 3Gbps Generation 2 speeds
- Supports device hot-plugging
- Supports power management
- Supports BIST loopback modes
- Dedicated DMA controller support to optimize performance and off load CPU
- Separate 512B transmit and receive buffers

NAND Flash Controller

The NAND Flash controller provides a simple interface between the EBC and up to four separate external NAND Flash devices. It provides both direct command, address, and data access to the external device as well as a memory-mapped linear region that generates data accesses. NAND Flash data is transferred on the peripheral data bus.

Features include:

- One to four banks supported on EBC
- Direct interface to:
 - Discrete NAND Flash devices (up to four devices)
 - SmartMedia Card socket (22-pins)
- Device sizes of 4MB and larger supported for read/write access
- (512 + 16)-B or (2K + 64)-B page sizes supported
- Boot from NAND supported with execution of up to 4KB of boot code out of block 0
- ECC generation - hamming code, single-bit correction, double-bit detection (SEC/DED):
 - ECC generation assist software with ECC checking of SLC NAND
 - No ECC checking supported when booting directly from block 0
- Chip select pins are multiplexed with EBC

General Purpose Timers (GPT)

Provides a separate time base counter and additional system timers in addition to those defined in the processor.

Features include:

- Time Base Counter (32 bits) driven by the OPB bus clock
- Seven 32-bit compare timers

General Purpose IO (GPIO) Controller

Controller functions and GPIO registers are programmed and accessed by means of memory-mapped OPB bus master accesses.

Features include:

- Sixty-four GPIOs multiplexed with other functions. DCRs control whether a GPIO pin acts as a GPIO or is used for another purpose.
- Each GPIO output is separately programmable to emulate an open drain driver (that is, drives to zero, tri-stated if output bit is 1).

Universal Interrupt Controller (UIC)

Universal Interrupt Controllers (UICs) provide control, status, and communications necessary between the external and internal sources of interrupts and the on-chip PowerPC processor.

Note: Processor specific interrupts (for example, page faults) do not use UIC resources.

Features include:

- Sixteen external interrupts
- Edge triggered or level-sensitive
- Positive or negative active
- Non-critical or critical interrupt to the on-chip processor
- Programmable interrupt priority ordering
- Programmable critical interrupt vector for faster vector processing

JTAG

Features include:

- IEEE 1149.1 Test Access Port
- JTAG Boundary Scan Description Language (BSDL)
- IBM RISCWatch support

Refer to <http://www.amcc.com/Embedded/Partners> for a list of AMCC partners supplying probes for use with this port.

Assembly Recommendations

Assembly recommendations from JEDEC standard J-STD-020 should be used unless recommended differently in the following table.

Table 3. Recommended Reflow Soldering Profile

Profile Feature	Sn-Pb Eutectic Assembly (PPC460EX-STxfff)	Pb Free Reflow Assembly (PPC460EX-SUxfff)
Average ramp-up rate	3°C/second max	3°C/second max
Preheat: <ul style="list-style-type: none"> • Temperature Min • Temperature Max • Time (min to max) 	100°C 150°C 60–120 seconds	150°C 200°C 60–120 seconds
Time Maintained Above: <ul style="list-style-type: none"> • Temperature • Time 	183°C 60–150 seconds	217°C 60–150 seconds
Peak Temperature	225°C	260°C
Time within 5°C of Actual Peak Temperature	20 seconds max	30 seconds max
Ramp-down Rate	6°C/second max	6°C/second max
Time 25°C to Peak Temperature	6 minutes max	8 minutes max

Table 4. JEDEC Moisture Sensitivity Level and Ball Composition

	Sn-Pb (PPC460EX-STxfff)	Pb Free (PPC460EX-SUxfff)
MSL Level	3	3
Solder Ball Metallurgy	63Sn/37Pb	Sn/4Ag/05Cu

Preliminary Data Sheet**Signal Lists**

The following table lists all the external signals in alphabetical order and shows the ball (pin) number on which the signal appears. Multiplexed signals are shown with the default signal (following reset) *not* in brackets and alternate signals in brackets. Multiplexed signals appear alphabetically multiple times in the list—once for each signal name on the ball. The page number listed gives the page in *Table 9* on page 64 where the signals in the indicated interface group begin. In cases where signals in the same interface group (for example, Ethernet) have different names to distinguish variations in the mode of operation, the names are separated by a comma with the primary mode name appearing first. In cases where the signals have the same function but are associated with different ports (for example, UART), the signals are separated by a slash (/). These signals are listed only once, and appear alphabetically by the primary mode or primary port name.

Preliminary Data Sheet

Signals in Ball Assignment Order

In the following table, only the default signal name is shown for each ball. Multiplexed or multifunction signals are marked with an asterisk (*). To determine what other signals or functions can be programmed to those balls, look up the default signal name in *Table 5* on page 25.

Table 6. Signals Listed by Ball Assignment (Part 1 of 9)

Ball	Signal Name	Ball	Signal Name	Ball	Signal Name	Ball	Signal Name

Preliminary Data Sheet**Signal Descriptions**

The PPC460EX embedded controller is packaged in a 728-ball thermally enhanced plastic ball grid array (TE-PBGA). The following tables describe the package level pin-out.

Table 7. Pin Summary

Group	No. of Pins
Total Signal Pins	430
V _{DD}	37
OV _{DD}	23
SOV _{DD}	16
E1OV _{DD}	10
E2OV _{DD}	2
GND	160
PAV _{DD}	2
AV _{DD}	18
AGND	17
EAV _{DD}	1
EAGND	1
SPAV _{DD}	1
SPAGND	1
Total Power Pins	289
Reserved	9
Total Pins	728

In the table *Table 9* on page 64, each I/O signal is listed along with a short description of its function. Active-low signals (for example, $\overline{\text{RAS}}$) are marked with an overline. Please see *Table 5* on page 25 for the pin (ball) number to which each signal is assigned.

Multiplexed Signals

Some signals are multiplexed on the same pin so that the pin can be used for different functions. In most cases, the signal names shown in the following table are not accompanied by signal names that might share the same pin. If you need to know what, if any, signals are multiplexed with a particular signal, look up the name in *Table 5* on page 25. It is expected that in any single application a particular pin will always be programmed to serve the same function. The flexibility of multiplexing allows a single chip to offer a richer pin selection than would otherwise be possible.

Note: Signals multiplexed with GPIO default to GPIO receivers and float after reset. Initialization software must configure the GPIO registers for the desired function as described in the GPIO section of the user's manual. Any of these signals requiring a particular state prior to running initialization code must be terminated with pull-ups or pull-downs.

Multipurpose Signals

In addition to multiplexing, some pins such as those carrying the EOTx/TCx signals are also multipurpose. Control of which function a multipurpose pin has is determined by direction, register settings, and so on. Both functions are shown separated by a slash (/).

Multimode Signals

In some cases (for example, Ethernet) the function of a pin may vary with different modes of operation. When a pin has multiple signal names assigned to distinguish different modes of operation, all of the names are shown separated by a comma.

Strapping Pins

One group of pins is used as strapped inputs during system reset. These pins function as strapped inputs only during reset and are used for other functions during normal operation (see “Strapping” on page 102). Note that these are *not multiplexed* pins since the function of the pins is not programmable.

Reserved Pins

The balls marked *Reserved* on this chip are not functional. However, some of the reserved balls cannot be left unconnected. Connect the balls shown in the following table as indicated:

Table 8. Non-Functional Ball Connections

Ball	Connection
AM15	1 k Ω to GND
AN15	1 k Ω to GND

Unused Interfaces

The following describes how to terminate the PCI, PCI Express, SATA, and GPIO signals that might not be used.

PCI:

When the PCI bridge is unused, configure the PCI controller to park on the bus by pulling the $\overline{\text{PCIReq0/GNT}}$ signal low. Parking forces the PLB4 to PCI bridge to actively drive PCI0AD0:31 and PCI0C0:3/BE0:3 greatly reducing the number of termination resistors required. The remaining PCI control signals must be terminated as follows:

- Disable the internal PCI arbiter. (See the Bootstrap Operation chapter in the user’s manual. Boot Options A-F automatically disable the PCI Arbiter.)
- $\overline{\text{PCI0SErr}}$ - Pull up through a 3k Ω resistor to +3.3V
- $\overline{\text{PCI0TRDY}}$ - Pull up through a 3k Ω resistor to +3.3V
- $\overline{\text{PCI0Stop}}$ - Pull up through a 3k Ω resistor to +3.3V.
- $\overline{\text{PCI0Req0/Gnt}}$ - Pull down through a 1k Ω resistor to GND.
- $\overline{\text{PCI0Req1:3}}$ - Individually pull up each signal through 3k Ω resistors to +3.3V.
- $\overline{\text{PCI0Clk}}$ - Requires a clock. The frequency must be between 1MHz and 66MHz.

PCI-E/SATA:

When the PCI Express 0/SATA interface is unused, terminate as follows:

- $\overline{\text{PCIE0AVReg[SATA0AVReg]}}$ - Leave unconnected.
- $\overline{\text{PCIE0CaIRN[SATA0CaIRN]}}$ - Leave unconnected.
- $\overline{\text{PCIE0CaIRP[SATA0CaIRP]}}$ - Leave unconnected.
- $\overline{\text{PCIE0RefClk[SATA0RefClk]}}$ - Pull down through a 1 k Ω resistor to GND.
- $\overline{\text{PCIE0RefClk[SATA0RefClk]}}$ - Pull down through a 1 k Ω resistor to GND.
- $\overline{\text{PCIE0Rx0[SATA0Rx0]}}$ - Pull down through a 1 k Ω resistor to GND.

Preliminary Data Sheet

- PCIE0Rx0[SATA0Rx0] - Pull down through a 1 k Ω resistor to GND.
- PCIE0Tx0[SATA0Tx0] - Leave unconnected.
- PCIE0Tx0[SATA0Tx0] - Leave unconnected.

When the PCI Express 1 interface is unused terminate as follows:

- PCIE1AVReg - Leave unconnected.
- PCIE1CaIRN - Leave unconnected.
- PCIE1CaIRP - Leave unconnected.
- PCIE1RefClk - Pull-down through a 1 k Ω resistor to GND.
- PCIE1RefClk - Pull-down through a 1 k Ω resistor to GND.
- PCIE1Rx0:3 - Individually pull-down each signal through a 1 k Ω resistor to GND.
- PCIE1Rx0:3 - Individually pull-down each signal through a 1 k Ω resistor to GND.
- PCIE1Tx0:3 - Leave unconnected.
- PCIE1Tx0:3 - Leave unconnected.

Signals Multiplexed with GPIO:

By default after reset, signals shared with GPIO pins are configured as GPIO receivers. Termination however, is not needed if the GPIO during initialization are configured as outputs. To configure as drivers, set and clear the appropriate bits in the GPIO_{On}_ODR, GPIO_{On}_TCR and GPIO_{On}_OR registers as described in the GPIO chapter of the user's manual.

Table 9. Signal Functional Description (Part 1 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
PCI Interface				
PCIAD00:31	Address/Data bus (bidirectional).	I/O	3.3V PCI	
PCIC0:3/ $\overline{\text{BE}}0:3$	PCI Command/Byte Enables.	I/O	3.3V PCI	
PCIOClk	Provides timing to the PCI interface for PCI transactions. Note: A clock is required even when the PCI interface is not used. The frequency must be between 1MHz and 66MHz.	I	3.3V PCI	1
$\overline{\text{PCIODevSel}}$	Indicates the driving device has decoded its address as the target of the current access. (PCI 2.2 specification requires an 8.2K Ω pull-up on host system.)	I/O	3.3V PCI	4
$\overline{\text{PCIOFrame}}$	Driven by the current master to indicate beginning and duration of an access. (PCI 2.2 specification requires an 8.2K Ω pull-up on host system.)	I/O	3.3V PCI	4
$\overline{\text{PCIOIRdy}}$	Indicates initiating agent's ability to complete the current data phase of the transaction. (PCI 2.2 specification requires an 8.2K Ω pull-up on host system.)	I/O	3.3V PCI	4
$\overline{\text{PCIOTRdy}}$	Indicates the target agent's ability to complete the current data phase of the transaction. (PCI 2.2 specification requires an 8.2K Ω pull-up on host system.)	I/O	3.3V PCI	4
$\overline{\text{PCIOStop}}$	Indicates the current target is requesting the master to stop the current transaction. (PCI 2.2 specification requires an 8.2K Ω pull-up on host system.)	I/O	3.3V PCI	4
$\overline{\text{PCIOPErr}}$	Reports data parity errors during all PCI transactions except a Special Cycle. (PCI 2.2 specification requires an 8.2K Ω pull-up on host system.)	I/O	3.3V PCI	4
$\overline{\text{PCIOSErr}}$	Reports address parity errors, data parity errors on the Special Cycle command, or other catastrophic system errors. (PCI 2.2 specification requires an 8.2K Ω pull-up on host system.)	I/O	3.3V PCI	4
$\overline{\text{PCIOReq0/Gnt}}$	Indicates to the PCI arbiter that the specified agent wishes to use the bus. When the internal arbiter is enabled, input is Req0. When internal arbiter is disabled, input is Gnt. (PCI 2.2 specification requires an 8.2K Ω pull-up on host system.)	I	3.3V PCI	2
$\overline{\text{PCIOReq1:3}}$	An indication to the PCI arbiter that the specified agent wishes to use the bus. Used only when internal PCI arbiter enabled.	I	3.3V PCI	2
$\overline{\text{PCIOGnt0/Req}}$	Indicates that the specified agent is granted access to the bus. When the internal arbiter is enabled, output is Gnt0. When the internal arbiter is disabled, output is Req.	O	3.3V PCI	
$\overline{\text{PCIOGnt1:3}}$	Indicates that the specified agent is granted access to the bus. Used only when internal PCI arbiter enabled.	O	3.3V PCI	
PCIOIDSel	Used as a chip select during configuration read and write transactions.	I	3.3V PCI	5
$\overline{\text{PCIOINT}}$	Level sensitive PCI interrupt.	O	3.3V PCI	
PCIO66En	Capable of 66MHz operation.	I	3.3V PCI	5
PCIOPar	Even parity across PCIAD00:31 and PCIC0:3/ $\overline{\text{BE}}0:3$ buses.	I/O	3.3V PCI	

Preliminary Data Sheet

Table 9. Signal Functional Description (Part 2 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
PCI0Reset	Brings PCI device registers and logic to a consistent state.	O	3.3V PCI	
PCI Express Interface (n = 0 and 1)				
PCIEnRefClk PCIEnRefClk	Reference Clock: 100MHz differential pair. Note: AC coupling required. See "PCI-E and SATA Reference Clock AC Coupling Recommendations" on page 100.	I	2.5V LVDS Rcvr w/term	
PCIEnAVReg	Analog obvservation point for manufacturing test of internal voltage regulator. Note: For normal operation, do not terminate.	na	Analog	
PCIEnCalRN PCIEnCalRP	Connect a 1.37k Ω \pm 1% external calibration resistor between these two pins.	na	Analog	
PCIEnRx0:3 PCIEnRx0:3	Differential receive signal pairs. PCIE0 is a single-channel (Rx0 only) interface. PCIE1 is a four-channel (Rx0:3) interface. Lane 0 is the LSB.	I	2.5V LVDS Rcvr w/term	
PCIEnTx0:3 PCIEnTx0:3	Differential transmit signal pairs. PCIE0 is a single-channel (Tx0 only) interface. PCIE1 is a four-channel (Tx0:3) interface. Lane 0 is the LSB. Note: AC couple only.	O	2.5V LVDS Drvr w/term	

Table 9. Signal Functional Description (Part 3 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
DDR2/1 SDRAM Interface				
BA0:2	Bank Address supporting up to eight internal banks.	O	2.5V (1.8V) SSTL2 Dr/Rcv	
BankSel0:3	Selects up to four external DDR SDRAM banks (a.k.a. ranks).	O	2.5V (1.8V) SSTL2 Dr/Rcv	
$\overline{\text{CAS}}$	Column Address Strobe.	O	2.5V (1.8V) SSTL2 Dr/Rcv	
ClkEn0:3	Clock Enable.	O	2.5V (1.8V) SSTL2 Dr/Rcv	
DM0:7 DM8	Memory write data byte lane masks. DM8 is the byte lane mask for the ECC byte lane.	O	2.5V (1.8V) SSTL2 Dr/Rcv	
DQS0:7 DQS0:7 DQS8 DQS8	Differential byte lane data strobe. Differential byte lane data strobe for ECC.	I/O	2.5V (1.8V) SSTL2 Diff Dr/Rcv	
ECC0:7	ECC check bits 0:7.	I/O	2.5V (1.8V) SSTL2 Dr/Rcv	
MemAddr00:14	Memory address bus. MemAddr14 is the most significant bit (msb).	O	2.5V (1.8V) SSTL2 Dr/Rcv	
MemData00:63	Memory data bus (MemData32:63 available for DDR2 only). MemData00 is the most significant bit (msb).	I/O	2.5V (1.8V) SSTL2 Dr/Rcv	
MemClkOut0:1 MemClkOut0:1	Subsystem clock outputs.	O	2.5V (1.8V) SSTL2 Dr/Rcv Diff Driver	
MemODT0:3	DDR2 On-die termination enable (not used with DDR1).	O	2.5V (1.8V) SSTL2 Dr/Rcv	
$\overline{\text{RAS}}$	Row Address Strobe.	O	2.5V (1.8V) SSTL2 Dr/Rcv	
$\overline{\text{WE}}$	Write Enable.	O	2.5V (1.8V) SSTL2 Dr/Rcv	
MemVRef1A:B	Memory voltage reference 1, A and B input.	I	Volt ref receiver (1.25V or 0.9V)	
MemVRef2A:B	Memory voltage reference 2, A and B input.	I	Volt ref driver (1.25V or 0.9V)	
MemDCFdbkD	Feedback driver for I/O timing measurements. Note: Connect directly to MemDCFdbkR. Use the shortest trace length possible. Do not include series termination or parallel termination to V _{tt} .	O	2.5V (1.8V) SSTL2 Dr/Rcv	
MemDCFdbkR	Feedback receiver. Connect externally to MemDCFdbkD.	I	2.5V (1.8V) SSTL2 Dr/Rcv	
$\overline{\text{HISRRst}}$	SDRAM hardware initiated self-refresh reset control.	I	3.3V LVTTTL	1, 2

Preliminary Data Sheet

Table 9. Signal Functional Description (Part 4 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
Ethernet 0 Interface				
GMCMDClk	GMII, MII, RGMII: Management data clock.	O	3.3V tolerant 2.5V CMOS	
GMCMDIO	GMII, MII, RGMII: Transfer command and status information between MII and PHY.	I/O	3.3V tolerant 2.5V CMOS	
GMCRefClk	GMII, SGMII, RGMII: 125MHz reference clock for 10/100/1000Mbps.	I	3.3V tolerant 2.5V CMOS	1, 5
GMC0GTxCIk, GMC0TxClk	GMII 0: Transmit clock for 1000Mbps. RGMII 0: Transmit clock for 1000Mbps.	O	3.3V tolerant 2.5V CMOS	
GMC0TxClk	GMII/MII 0: Transmit clock for 10/100Mbps.	I	3.3V tolerant 2.5V CMOS	1, 5
GMC0TxD1:0, GMC0TxD1:0	GMII/MII 0: Transmit data. RGMII 0: Transmit data.	O	3.3V tolerant 2.5V CMOS	
GMC0TxD3:2, GMC0TxD3:2	GMII/MII 0: Transmit data. RGMII 0: Transmit data.	O	3.3V tolerant 2.5V CMOS	
GMC0TxD7:4, GMC1TxD3:0	GMII 0: Transmit data. RGMII 1: Transmit data.	O	3.3V tolerant 2.5V CMOS	
GMC0TxEn, GMC0TxCtl	GMII/MII 0: Transmit enable. RGMII 0: Transmit control.	O	3.3V tolerant 2.5V CMOS	
GMC0TxEr, GMC1TxCtl	GMII/MII 0: Transmit error. RGMII 1: Transmit control.	O	3.3V tolerant 2.5V CMOS	
GMC0CD, GMC1RxClk	GMII/MII 0: Collision detection. RGMII 1: Receive clock.	I	3.3V tolerant 2.5V CMOS	1, 5
GMC0CrS, GMC1GTxCIk	GMII/MII 0: Carrier sense. RGMII 1: Transmit clock for 1000 Mbps.	I/O	3.3V tolerant 2.5V CMOS	
GMC0RxClk, GMC0RxClk	GMII/MII 0: Receive clock. RGMII 0: Receive clock.	I	3.3V tolerant 2.5V CMOS	1, 5
GMC0RxD1:0, GMC0RxD1:0	GMII/MII 0: Receive data. RGMII 0: Receive data.	I	3.3V tolerant 2.5V CMOS	5
GMC0RxD3:2, GMC0RxD3:2	GMII/MII 0: Receive data. RGMII 0: Receive data.	I	3.3V tolerant 2.5V CMOS	5
GMC0RxD7:4, GMC1RxD3:0	GMII/MII 0: Receive data. RGMII 1: Receive data.	I	3.3V tolerant 2.5V CMOS	5
GMC0RxDV, GMC0RxCtl	GMII/MII 0: Receive data valid. RGMII 0: Receive control.	I	3.3V tolerant 2.5V CMOS	5
GMC0RxEr, GMC1RxCtl	GMII/MII 0: Receive error. RGMII 1: Receive control.	I	3.3V tolerant 2.5V CMOS	5

Table 9. Signal Functional Description (Part 5 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
Ethernet SGMII Gigabit Interface				
SGMIITxCIk SGMIITxCiK	Differential transmit clock: Common 625MHz to PHYs.	O	1.8V LVDS Drvr w/term	
SGMII0:1RxCIk SGMII0:1RxCIk	Differential receive clock: 625MHz from PHY. The differential receiver clock is required for SGMII. Clock recovery from the differential SGMII0:2RxD signals is not supported.	I	1.8V LVDS Rcvr w/term	
SGMII0:1RxD SGMII0:1RxD	Differential receive data.	I	1.8V LVDS Rcvr w/term	
SGMII0:1TxD SGMII0:1TxD	Differential transmit data.	O	1.8V LVDS Drvr w/term	
SATA Interface				
SATA0RefCIk SATA0RefCIk	Reference Clock: 100 MHz differential clock pair. Note: AC coupling required. See "PCI-E and SATA Reference Clock AC Coupling Recommendations" on page 100.	I	2.5V LVDS Rcvr w/term	
SATA0Rx0 SATA0Rx0	Data Receive differential signals. Note: Must be AC coupled.	I	2.5V LVDS Rcvr w/term	
SATA0Tx0 SATA0Tx0	Data Transmit differential signals. Note: Must be AC coupled.	O	2.5V LVDS Drvr w/term	
SATA0AVReg	Analog obvservation point for manufacturing test of internal voltage regulator. Note: For normal operation, do not terminate.	na	Analog	
SATA0CalRP SATA0CalRN	Connect a 1.37k Ω \pm 1% external calibration resistor between these two pins.	na	Analog	

Preliminary Data Sheet

Table 9. Signal Functional Description (Part 6 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
DMA Interface				
DMAAck0:3	External peripheral DMA acknowledge. Used by the PPC460EX to indicate that data transfers have occurred.	O	3.3V LVTTTL	
DMAReq0:3	External peripheral DMA request. Used by slave peripherals to indicate they are prepared to transfer data.	I	3.3V LVTTTL	5
EOT0:3/TC0:3	End Of Transfer/Terminal Count.	I/O	3.3V LVTTTL	5
External Peripheral Interface				
PerAddr05:31	Peripheral address bus used by the PPC460EX. PerAddr05 is the most significant bit (msb) on this bus.	I/O	3.3V LVTTTL	
PerData00:31	Peripheral data bus used by the PPC460EX. PerData00 is the most significant bit (msb) on this bus.	I/O	3.3V LVTTTL	
PerPar0:3	Peripheral data bus parity used by the PPC460EX.	I/O	3.3V LVTTTL	
PerBLast	Last burst transfer. Used by either the peripheral controller or DMA controller to indicates the last transfer of a memory access.	I/O	3.3V LVTTTL	
PerCS0:5	External peripheral device select.	O	3.3V LVTTTL	
PerOE	Output enable. Used by either peripheral controller or DMA controller depending upon the type of transfer involved. When the PPC460EX is the bus master, it enables the selected device to drive the bus.	O	3.3V LVTTTL	
PerReady	Used by a peripheral slave to indicate it is ready to transfer data.	I	3.3V LVTTTL Rcvr	1, 2
PerR/W	Read/Write. Used by the PPC460EX as an output by either the peripheral controller or DMA controller depending upon the type of transfer involved. High indicates a read from memory, low indicates a write to memory.	I/O	3.3V LVTTTL	
PerWBE0:3	External peripheral data bus byte enables.	I/O	3.3V LVTTTL	
PerErr	External Error. Used as an input to record external slave peripheral errors.	I	3.3V LVTTTL Rcvr	1, 5
ExtReset	Peripheral Reset. Used by synchronous peripheral slaves. Note: The state of any external signals or clocks cannot be guaranteed until the ExtReset signal has been de-asserted.	O	3.3V LVTTTL	
PerClk	Peripheral Clock. Used by synchronous peripheral slaves.	O	3.3V LVTTTL	

Table 9. Signal Functional Description (Part 7 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
UART Peripheral Interface				
The UART interface can be configured as follows:				
1. One 8-pin, where n = 0				
2. Two 4-pin, where n = 0 & 1				
3. Four 2-pin, where n = 0 & 1 & 2 & 3				
UARTSerClk	This input provides an alternative to the internally generated serial clock. It is used in cases where the allowable internally generated clock rates are not satisfactory.	I	3.3V LVTTTL w/pull-up	1
UARTnRx	Receive data.	I	3.3V LVTTTL	
UARTnTx	Transmit data.	O	3.3V LVTTTL	
UARTnDCD	Data Carrier Detect.	I	3.3V LVTTTL	6
UARTnDSR	Data Set Ready.	I	3.3V LVTTTL	6
UARTnCTS	Clear To Send.	I	3.3V LVTTTL	6
UARTnDTR	Data Terminal Ready.	O	3.3V LVTTTL	
UARTnRTS	Request To Send.	O	3.3V LVTTTL	
UARTnRI	Ring Indicator.	I	3.3V LVTTTL	
IIC Peripheral Interface (n = 0 and 1)				
IICnSClk	IIC0 Serial Clock.	I/O	3.3V LVTTTL	1, 2
IICnSData	IIC0 Serial Data.	I/O	3.3V LVTTTL	2
USB 2.0 OTG (Device or Host) Interface				
USB2DD7:0	Bidirectional Device data bus.	I/O	3.3V tolerant 2.5V CMOS	
USB2DDir	Transfer direction. PHY has data to transfer.	I	3.3V tolerant 2.5V CMOS	1
USB2DNext	Next transfer. Input signal from the PHY: Receiving—ready to accept the next data transfer. Transmitting—a new byte is ready to send.	I	3.3V tolerant 2.5V CMOS	1
USB2DStop	Stop transfer. Output signal to the PHY: Receiving—stop transferring data. Transmitting—the last byte of data has been sent.	O	3.3V tolerant 2.5V CMOS	
USB2DClk	USB 2.0 OTG clock—60MHz.	I	3.3V tolerant 2.5V CMOS	1, 5

Preliminary Data Sheet

Table 9. Signal Functional Description (Part 8 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
USB 2.0 Host Interface				
USB2HD7:0	Bidirectional Host data bus.	I/O	3.3V tolerant 2.5V CMOS	
USB2HDir	Transfer direction. PHY has data to transfer.	I	3.3V tolerant 2.5V CMOS	1
USB2HNext	Next transfer. Input signal from the PHY: Receiving—ready to accept the next data transfer. Transmitting—a new byte is ready to send.	I	3.3V tolerant 2.5V CMOS	1, 5
USB2HStop	Stop transfer. Output signal to the PHY: Receiving—stop transferring data. Transmitting—the last byte of data has been sent.	O	3.3V tolerant 2.5V CMOS	
USB2HCik	USB 2.0 Host clock—60MHz.	I	3.3V tolerant 2.5V CMOS	1, 5
USB2HCik48	USB 2.0 Host clock—48MHz.	I	3.3V tolerant 2.5V CMOS	1, 5
NAND Flash Interface				
NFALE	Address Latch Enable.	O	3.3V LVTTTL	
NFCLE	Command Latch Enable. Latches operational commands into the NAND Flash.	O	3.3V LVTTTL	
NFRdyBusy	Ready/Busy. Indicates status of device during program erase or page read. This signal is wire-OR connected from all NAND Flash devices.	I	3.3V LVTTTL	
NFREn	Read Enable. Data is latched on the rising edge.	O	3.3V LVTTTL	
NFWEn	Write Enable. Data is latched on the rising edge.	O	3.3V LVTTTL	
NFCE0:3	Chip enable.	O	3.3V LVTTTL	
Serial Peripheral Interface				
SPICikOut	Clock output.	O	3.3V LVTTTL	1
SPIDI	Data input.	I	3.3V LVTTTL w/pull-up	2
SPIDO	Data output.	O	3.3V LVTTTL	
Interrupts Interface				
IRQ0:15	External interrupt requests 0 through 15.	I	3.3V LVTTTL	1, 5

Table 9. Signal Functional Description (Part 9 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
JTAG Interface				
TCK	Test Clock.	I	3.3V LVTTTL w/pull-up	1
TDI	Test Data In.	I	3.3V LVTTTL w/pull-up	
TDO	Test Data Out.	O	3.3V LVTTTL	
TMS	Test Mode Select.	I	3.3V LVTTTL w/pull-up	
$\overline{\text{TRST}}$	Test Reset. During chip power-up, this signal must be low from the start of V _{DD} ramp-up until at least 32 SysClk cycles after V _{DD} is stable in order to initialize the JTAG controller.	I	3.3V LVTTTL w/pull-up	5
System Interface				
SysClk	Main system clock input.	I	3.3V tolerant 2.5V CMOS	1
SysErr	Set to 1 when a machine check is generated.	O	3.3V tolerant 2.5V CMOS	
$\overline{\text{SysReset}}$	Main system reset. External logic can drive this pin low (minimum of 32 SysClk cycles) to initiate a system reset. A system reset can also be initiated by software.	I	3.3V tolerant 2.5V CMOS	1, 2
TmrClk	Processor timer external input clock.	I	3.3V LVTTTL w/pull-up	1
$\overline{\text{Halt}}$	Halt from external debugger.	I	3.3V LVTTTL w/pull-up	1
FSOURCE0	Reserved, Manufacturing Test Signal Must connect to GND (no pull-down resistor required).	I	N/A	
TestEn	Test enable. Note: Do not connect for normal operation.	I	3.3V LVTTTL w/pull-down	
GPIO00:21	General purpose I/O.	I/O	3.3V tolerant 2.5V CMOS	
GPIO22:63	General purpose I/O.	I/O	3.3V LVTTTL	
TherMonA	On-chip thermal monitor (P diffusion).	I	Thermal monitor	
TherMonB	On-chip thermal monitor (N diffusion).	O		
Trace Interface				
TrcBS0:2	Trace branch execution status.	O	3.3V LVTTTL	
TrcClk	Trace data capture clock; runs at 1/4 the frequency of the processor.	O	3.3V LVTTTL	
TrcES0:4	Trace Execution Status is presented every fourth processor clock cycle.	O	3.3V LVTTTL	
TrcTS0:6	Additional information on trace execution and branch status.	O	3.3V LVTTTL	

Preliminary Data Sheet

Table 9. Signal Functional Description (Part 10 of 10)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} or 8.2k Ω for PCI to OV_{DD} or equivalent).
3. Must pull down (recommended value is 1k Ω to GND)
4. If not used, must pull up (recommended value is 3k Ω for LVTTTL or 8.2k Ω for PCI to OV_{DD} or equivalent).
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up (recommended value is 3k Ω to OV_{DD}) or pull-down (recommended value is 1k Ω to GND) required

Signal Name	Description	I/O	Type	Notes
Other				
Reserved	To avoid noise pickup problems, some of these balls must be connected in the board design as shown <i>Table 8</i> on page 62. Otherwise, do not connect voltage, ground, or any signals to these pins.	na	na	
Power				
V _{DD}	+1.25V—Logic voltage.	na	na	
OV _{DD}	+3.3V—I/O voltage (except DDR SDRAM, Ethernet, and USB).	na	na	
SOV _{DD}	+1.8V (DDR2) or +2.5V (DDR1)—I/O voltage for DDR SDRAM.	na	na	
E1OV _{DD}	+2.5V—I/O voltage for Ethernet (except SGMII) and USB.	na	na	
E2OV _{DD}	+1.8V—I/O Ethernet (SGMII).	na	na	
GND	Ground for logic and I/O voltages.	na	na	
AV _{DD}	+1.25V—PCI-Express SerDes Analog Supply.	na	na	
PAV _{DD}	+2.5V—PCI-Express SerDes PLL Analog Supply.	na	na	
AGND	Ground for AV _{DD} and PAV _{DD} .	na	na	
EAV _{DD}	+2.5V—Filtered analog voltage for Ethernet PLLs.	na	na	
EAGND	Ground for EAV _{DD} .	na	na	
SPAV _{DD}	+2.5V—Filtered analog voltage for system PLL.	na	na	
SPAGND	Ground for SPAV _{DD} .	na	na	

Device Characteristics

Table 10. Absolute Maximum Ratings

The absolute maximum ratings below are stress ratings only. Operation at or beyond these maximum ratings can cause permanent damage to the device. None of the performance specification contained in this document are guaranteed when operating at these maximum ratings.

Characteristic	Symbol	Value	Unit	Notes
Internal logic supply voltage	V_{DD}	0 to +1.6	V	
I/O supply voltage	OV_{DD}	0 to +3.6	V	
Ethernet I/O and USB supply voltage	$E1OV_{DD}$	0 to +2.7	V	
Ethernet SGMII supply voltage	$E2OV_{DD}$	0 to +1.9	V	
DDR2 (DDR1) SDRAM I/O supply voltage	SOV_{DD}	0 to +1.9 (+2.7V)	V	
PCI-Express SerDes analog supply voltage	AV_{DD}	0 to +1.6	V	1
System PLL analog supply voltage	$SPAV_{DD}$	0 to +2.7	V	1
Ethernet PLL analog supply voltage	EAV_{DD}	0 to +2.7	V	1
PCI-Express SerDes PLL analog supply voltage	PAV_{DD}	0 to +2.7	V	1
Storage Temperature Range	T_{STG}	-55 to +150	°C	
Case temperature under bias	T_C	-40 to +120	°C	2

Notes:

- The analog voltages (AV_{DD} , EAV_{DD} , $SPAV_{DD}$, and PAV_{DD}) used for the on-chip functions can be derived from the logic voltages, but must be filtered before entering the PPC460EX. A separate filter for each analog voltage, as shown below, is recommended:

- AV_{DD} L – SMT ferrite bead chip, Murata BLM18AG121SN1D
C – 0.1µF ceramic
- EAV_{DD} , $SPAV_{DD}$, and PAV_{DD}
L – SMT ferrite bead chip, Murata BLM15AG102SN1
C – 1µF ceramic

- This value is not a specification of the operational temperature range; it is a stress rating only.

Preliminary Data Sheet

Table 11. Recommended DC Operating Conditions (Part 1 of 2)

Device operation beyond the conditions specified is not recommended. Extended operation beyond the recommended conditions can affect device reliability.

Parameter	Symbol	Minimum	Typical	Maximum	Unit	Notes
Logic Supply Voltage	V_{DD}	+1.2	+1.25	+1.3	V	4
I/O Supply Voltage	OV_{DD}	+3.15	+3.3	+3.45	V	4
Ethernet 1 I/O Supply Voltage	$E1OV_{DD}$	+2.4	+2.5	+2.6	V	4
Ethernet 2 I/O Supply Voltage (SGMII)	$E2OV_{DD}$	+1.7	+1.8	+1.9	V	4
DDR2 (DDR1) SDRAM I/O Supply Voltage	SOV_{DD}	+1.7 (+2.4)	+1.8 (+2.5)	+1.9 (+2.6)	V	4
PCI-Express SerDes analog Supply Voltage	AV_{DD}	+1.2	+1.25	+1.3	V	3
System PLL Analog Supply Voltage	$SPAV_{DD}$	+2.4	+2.5	+2.6	V	3
Ethernet PLL analog supply voltage	EAV_{DD}	+2.4	+2.5	+2.6	V	3
PCI-Express SerDes PLL analog supply voltage	PAV_{DD}	+2.4	+2.5	+2.6	V	3
DDR2 (DDR1) SDRAM Reference Voltage	SV_{REF}	$0.49SOV_{DD}$	$0.50SOV_{DD}$	$0.51SOV_{DD}$	V	3
Input Logic High 3.3V LVTTTL and PCI	V_{IH}	+2.0		+3.6	V	1
Input Logic High 2.5V CMOS, 3.3V tolerant		+1.7		+3.6	V	
Input Logic High 1.8V DDR2 (2.5V DDR1)		$SV_{REF} + 0.125$ (0.15)		2.2 (3.0)	V	2
Input Logic High (1.8V SGMII)		+1.1		+2.2	V	
Input Logic Low 3.3V LVTTTL and PCI	V_{IL}	0		+0.8	V	1
Input Logic Low 2.5V CMOS		0		+0.7	V	
Input Logic Low 1.8V DDR2 (2.5V DDR1)		-0.3 (-0.3)		$SV_{REF} - 0.125$ (0.18)	V	2
Input Logic Low (1.8V SGMII)		+0.3		+0.8	V	
Output Logic High 3.3V LVTTTL and PCI	V_{OH}	+2.4		+3.6	V	1
Output Logic High 2.5V CMOS		+2.0		+2.7	V	
Output Logic High 1.8V DDR2 (2.5V DDR1)		$SOV_{DD} - 0.95$ (+1.95)		SOV_{DD}	V	
Output Logic High (1.8V SGMII)		+1.23	+1.385	+1.534	V	
Output Logic Low 3.3V LVTTTL and PCI	V_{OL}	0		+0.4	V	1
Output Logic Low 2.5V CMOS		0		+0.4	V	
Output Logic Low 1.8V DDR2 (2.5V DDR1)		0		+0.45	V	
Output Logic Low (1.8V SGMII)		+0.841	+0.961	+1.081	V	
Input Leakage Current (no pull-up or pull-down)	I_{IL1}	0		0	μA	
Input Leakage Current for pull-down	I_{IL2}	0 (LPDL)		200 (MPUL)	μA	5
Input Leakage Current for pull-up	I_{IL3}	-150 (LPDL)		0 (MPUL)	μA	5

Table 11. Recommended DC Operating Conditions (Part 2 of 2)

Device operation beyond the conditions specified is not recommended. Extended operation beyond the recommended conditions can affect device reliability.

Parameter	Symbol	Minimum	Typical	Maximum	Unit	Notes
Input Max Allowable Overshoot 2.5V CMOS	$V_{\text{IMAO}25}$			+3.9	V	
Input Max Allowable Overshoot 3.3V LVTTTL	$V_{\text{IMAO}33}$			+3.9	V	
Input Max Allowable Undershoot 2.5V CMOS	$V_{\text{IMAU}25}$	-0.6			V	
Input Max Allowable Undershoot 3.3V LVTTTL	$V_{\text{IMAU}33}$	-0.6			V	
Output Max Allowable Overshoot 2.5V CMOS	$V_{\text{OMAO}25}$			+3.9	V	
Output Max Allowable Overshoot 3.3V LVTTTL	$V_{\text{OMAO}33}$			+3.9	V	
Output Max Allowable Undershoot 2.5V CMOS	$V_{\text{OMAU}25}$	-0.6			V	
Output Max Allowable Undershoot 3.3V LVTTTL	$V_{\text{OMAU}33}$	-0.6			V	
Case Temperature	T_C	-40		+85	°C	6

Notes:

1. PCI drivers meet PCI specifications.
2. $SV_{\text{REF}} = SOV_{\text{DD}}/2$. $SOV_{\text{DD}} = +1.8\text{V}$ for DDR2 memory or $+2.5\text{V}$ for DDR1 memory.
3. The analog voltages used for the on-chip PLLs can be derived from the logic voltages, but must be filtered before entering the PPC460EX. See "Absolute Maximum Ratings" on page 74.
4. LPDL is least positive down level; MPUL is most positive up level.
5. Case temperature, T_C , is measured at top center of case surface with device soldered to a circuit board.

Table 12. 3.3V, 2.5V, and LVDS I/O Characteristics

Interfaces	I/O	Output Impedance (Ω)	Input Capacitance (pF)
Ethernet (MII, RGMII), SysClk, SysErr, GPIO00:21	3.3V tolerant 2.5V CMOS	50	5.7
Ethernet (SGMII)	1.8V LVDS	-	5.0
DMA, NAND Flash External Peripheral, UART, USB, Interrupt, JTAG, TmrClk, Halt, GPIO22:63, Trace	3.3V LVTTTL	50	5.2
IIC, SPI	3.3V LVTTTL	35	5.2
PCI	3.3V	-	5.7

Power Supply Sequencing

All the PPC460EX I/O designs are power supply sequence independent. There is no requirement that the power supplies power up in any particular order. The following items are power sequence considerations:

- Logic power (V_{DD}) is applied before the I/O supply voltages: The I/Os include internal supply sequencing circuitry which ensures the output of the receiver connected to internal chip logic is 0 until the I/O power is applied. When the logic power is on and the I/O power supplies are off, the I/O logic connected to the associated ball neither sinks or sources significant current unless influenced by an internal pull-up or pull-down resistor. While the I/O supply is ramping, the state of the I/O ball is not predictable. This power sequence is not destructive to the I/Os or internal logic and does not cause any functional problems.
- I/O power is applied before the logic power is applied: The output driver (connected the balls) comes up in an unknown state (driving 1, driving 0, or tri-state) until the internal logic voltage is stable within normal operating range. This power sequence is not destructive to the I/Os or internal logic and does not cause any functional problems.

Preliminary Data Sheet

- External voltage should not be applied to the chip I/O balls before the associated I/O power supply voltage is applied to the chip.
- A chip power-down cycle must complete (all I/O supply voltages and VDD are below +0.4V) before a new power-up cycle is started
- During a power-up cycle, $\overline{\text{SysReset}}$ and $\overline{\text{TRST}}$ inputs should be asserted low. $\overline{\text{SysReset}}$ and $\overline{\text{TRST}}$ should remain asserted until SysClock is stable and at least 32 SysClock times after all power supplies are stable within normal operating range. Failure to follow this reset sequence during the power-up cycle can result in unpredictable operation of the chip.

Power Specifications

The following tables contain measured power numbers. The measurement conditions are listed as **Notes** below each table.

Table 13. Typical DC Power Supply Requirements Using DDR2 Memory

Frequency (MHz)	+1.25V Supply (V _{DD} +AV _{DD})	+1.8V Supply (SOV _{DD} +E2OV _{DD})	+2.5V Supply (E1OV _{DD} +EAV _{DD} + SPAV _{DD} +PAV _{DD})	+3.3V Supply (OV _{DD})	Total	Unit	Notes
600	2.90	0.33	0.31	0.37	3.91	W	1
800	3.06	0.34	0.31	0.37	4.08	W	1
1000	3.83	0.34	0.31	0.38	4.86	W	1

Notes:

1. Measured at T_C = +85°C, using a typical process part for each speed grade, while running Linux and test applications that exercise each function with representative traffic (RGMII Ethernet).
2. 600MHz, 800MHz, and 1000MHz parts use a nominal voltage of V_{DD} = +1.25V, DDR2 running at 400MHz, and the PLB running at 200MHz.

Table 14. Typical DC Power Supply Requirements Using DDR1 Memory

Frequency (MHz)	+1.25V Supply (V _{DD} +AV _{DD})	+1.8V Supply (E2OV _{DD})	+2.5V Supply (E1OV _{DD} +EAV _{DD} + SPAV _{DD} +PAV _{DD} + SOV _{DD})	+3.3V Supply (OV _{DD})	Total	Unit	Notes
600	2.90	0.01	1.18	0.37	4.46	W	1
800	3.06	0.01	1.18	0.37	4.63	W	1
1000	3.83	0.01	1.18	0.38	5.39	W	1

Notes:

1. Estimated and based on a nominal voltage of V_{DD} = +1.25V, T_C = 85°C, while running Linux and a test application that exercises each function with representative traffic (RGMII Ethernet).
2. 600MHz, 800MHz, and 1000 MHz parts use a maximum voltage of V_{DD} = +1.30V.

Table 15. Maximum DC Power Supply Requirements Using DDR2 Memory

Frequency (MHz)	+1.25V Supply ($V_{DD}+AV_{DD}$)	+1.8V Supply ($SOV_{DD}+E2OV_{DD}$)	+2.5V Supply ($E1OV_{DD}+EAV_{DD}+SPAV_{DD}+PAV_{DD}$)	+3.3V Supply (OV_{DD})	Total	Unit	Notes
600	7.35	0.39	0.34	0.83	8.91	W	1, 2
800	7.66	0.39	0.34	0.83	9.22	W	1, 2
1000	7.87	0.39	0.34	0.85	9.45	W	1, 2

Notes:

1. Measured at $T_C = +85^\circ\text{C}$, using a best-case process (worst case power) part, while running Linux and test applications that exercise each function with representative traffic (RGMII Ethernet).
2. 600MHz, 800MHz, and 1000MHz parts use a nominal voltage of $V_{DD} = +1.30\text{V}$, DDR2 running at 400MHz, and the PLB running at 200MHz.

Table 16. Maximum DC Power Supply Requirements Using DDR1 Memory

Frequency (MHz)	+1.25V Supply ($V_{DD}+AV_{DD}$)	+1.8V Supply ($E2OV_{DD}$)	+2.5V Supply ($E1OV_{DD}+EAV_{DD}+SPAV_{DD}+PAV_{DD}+SOV_{DD}$)	+3.3V Supply (OV_{DD})	Total	Unit	Notes
600	7.35	0.01	1.22	0.83	9.41	W	1, 2
800	7.66	0.01	1.22	0.83	9.72	W	1, 2
1000	7.87	0.01	1.25	0.85	9.98	W	1, 2

Notes:

1. Measured at $T_C = +85^\circ\text{C}$, using a best-case process (worst case power) part, while running Linux and test applications that exercise each function with representative traffic (RGMII Ethernet).
2. 600MHz, 800MHz, and 1000MHz parts use a nominal voltage of $V_{DD} = +1.30\text{V}$, DDR2 running at 400MHz, and the PLB running at 200MHz.

Preliminary Data Sheet

Table 17. DC Power Supply Loads

Parameter	Symbol	Typical ⁴	Maximum ^{3, 5}	Unit	Notes
V _{DD} (+1.25V) active operating current	I _{DD}	3065	6055	mA	
OV _{DD} (+3.3V) active operating current	I _{ODD}	115	250	mA	
E1OV _{DD} (+2.5V) active operating current	I _{E1ODD}	124	132	mA	
E2OV _{DD} (+1.8V) active operating current	I _{E2ODD}	3	50	mA	
SOV _{DD} (+1.8V) DDR2 active operating current ²	I _{SODD2}	210	300	mA	
SOV _{DD} (+2.5V) DDR1 active operating current ²	I _{SODD1}	376	450	mA	
AV _{DD} (+1.25V) input current ¹	I _{ADD}	4	5	mA	1
EAV _{DD} (+2.5V) active operating current ¹	I _{EADD}	1	2	mA	1
PAV _{DD} (+2.5V) active operating current ¹	I _{UADD}	1	2	mA	1
SPAV _{DD} (+2.5V) active operating current ¹	I _{UADD}	1	2	mA	1

Notes:

1. See "Absolute Maximum Ratings" on page 74 for filter recommendations.
2. SOV_{DD} will be either +2.5V or +1.8V but not both.
3. The maximum current values listed above are not guaranteed to be the highest obtainable. These values are dependent on many factors including the type of applications running, clock rates, use of internal functional capabilities, external interface usage, case temperature, and the power supply voltages. Your specific application can produce significantly different results. V_{DD} (logic) current and power are primarily dependent on the applications running and the use of internal chip functions (DMA, PCI, Ethernet, and so on). OV_{DD} (I/O) current and power are primarily dependent on the capacitive loading, frequency, and utilization of the external buses.
4. Typical current is estimated at 1.000GHz with V_{DD} = +1.25V, OV_{DD} = +3.3V, E1OV_{DD} = +2.5V, SOV_{DD} = +2.5V (DDR1) or +1.8V (DDR2), and T_C = +85°C with a typical process.
5. Maximum current is estimated at 1.000GHz with V_{DD} = +1.3V, OV_{DD} = +3.45V, E1OV_{DD} = +2.6V, SOV_{DD} = +2.6V (DDR1) or +1.9V (DDR2), and T_C = +85°C, and best-case process (which drives worst-case power).

Package Thermal Specifications

Table 18. Package Thermal Specifications

Thermal resistance values for the TE-PBGA package in a convection environment are as follows:

Parameter	Symbol	Airflow ft/min (m/sec)						Unit	Notes
		0 (0)	100 (0.51)	200 (1.02)	300 (1.53)	400 (2.04)	600 (2.55)		
Junction-to-ambient thermal resistance <i>without</i> heat sink	θ_{JA}	13.1	11.7	10.9	10.5	10.3	10		3
Junction-to-ambient thermal resistance <i>with</i> heat sink	θ_{JA}	10.3	7.3	6.1	5.6	5.4	5.1		3, 6
		Resistance Value							
Junction-to-case thermal resistance	θ_{JC}	3.5						°C/W	3
Junction-to-board thermal resistance	θ_{JB}	7.3						°C/W	3

Notes:

1. Case temperature, T_C , is measured at top center of case surface with device soldered to circuit board.
2. $T_A = T_C - P \times \theta_{CA}$, where T_A is ambient temperature and P is power consumption.
3. $T_{CMax} = T_{JMax} - P \times \theta_{JC}$, where T_{JMax} is maximum junction temperature (+125°C) and P is power consumption.
4. The preceding equations assume that the chip is mounted on a board with at least one signal and two power planes.
5. Values in the table were achieved using a JEDEC standard board with the following characteristics: 114.5mm x 101.6mm x 1.6mm, 4 layers. The board has 100 thermal vias (same as the number of thermal balls on the TE-PBGA package).
6. Values for an attached heat sink were achieved with a 35mm x 35mm x 15mm unit (see Thermal Management below), attached with a 0.1mm thickness of adhesive having a thermal conductivity of 1.3W/mK.

Heat Sink

The following heat sink was used in the above thermal analysis:

35W x 35L x 15H (mm)

Base thickness = 1.5mm

Fin height = 13.5mm

Fin thickness = 1.0mm

Number of Fins: 11 aluminum

Preliminary Data Sheet**Thermal Monitor**

Thermal monitoring of the chip is accomplished using the PNP transistor ($\beta \approx 2$) provided on the chip. The collector of the transistor is connected to ground (GND). The emitter (TherMonA) and base (TherMonB) are connected to chip pins. A voltage measurement (V_{BE1} and V_{BE2}) across the TherMonA and TherMonB pins at the two current values I_1 and I_2 provides the chip temperature in °K according to the equation:

$$T = (q/nk)(V_{BE2} - V_{BE1}) / \ln(I_2/I_1) \text{ } ^\circ K \quad \text{where } q = 1.602\ 176\ 53 \times 10^{-19}, n = 0.99 \pm 0.05, \text{ and } k = 1.380\ 6505 \times 10^{-23}.$$

Note: V_{BE2} and V_{BE1} should be specified in volts. I_1 and I_2 can be any units of measure provided they are the same. The small values require precision measurement and current sources.

Note: The bias voltage V_{EB} should be between +0.5V and +0.7V.

Clocking Specifications

Table 19. Clocking Specifications

Symbol	Parameter	Min	Max	Units	Notes
SysClk Input					
F_C	Frequency	66.66	100	MHz	1
T_C	Period	10	15	ns	
T_{CS}	Edge stability (cycle-to-cycle jitter)	–	± 0.1	ns	2
T_{CH}	High time	40% of nominal period	60% of nominal period	ns	
T_{CL}	Low time	40% of nominal period	60% of nominal period	ns	
Note: Input rising and falling edge slew rate $\geq 1V/ns$					3
PLL VCO					
F_C	Frequency	600	2000	MHz	
T_C	Period	0.50	1.66	ns	
Processor (CPU) Clock					
F_C	Frequency	400	1000	MHz	4
T_C	Period	1.00	2.5	ns	
MemClkOut and PLB Clock					
F_C	Frequency	133.33	200	MHz	
T_C	Period	5	7.5	ns	
T_{CH}	High time	45% of nominal period	55% of nominal period	ns	
OPB Clock					
F_C	Frequency	66.66	100	MHz	5
T_C	Period	10	15	ns	
AHB Clock					
F_C	Frequency	66.66	200	MHz	
T_C	Period	5	15	ns	

Notes:

1. SysClk supports spread spectrum clocking with a -1% down-spread and a 40 kHz or less modulation frequency. For a 66.66 MHz minimum SysClk, the modulation frequency range 66.00 MHz to 66.66 MHz is supported.
2. The modulation frequency of the input jitter should be lower than 100 kHz (to allow the PLL to track the jitter) or higher than 20 MHz (to allow the PLL to filter the jitter). Within the frequency range 100 kHz to 20 MHz, the cycle to cycle jitter must be +/- 100 ps or less.
3. Slew rate is measured between 0.7V and 1.7V.
4. The maximum supported processor clock frequency for any part is specified in the part number (see "Ordering and PVR Information" on page 5).
5. In order to support a 1-Gbps Ethernet data rate, the minimum OPB clock frequency is 66.66 MHz. If the Ethernet application is limited to 100 Mbps, the minimum OPB clock frequency is 33.33 MHz.

Preliminary Data Sheet

Figure 4. Timing Waveform

**Spread Spectrum Clocking**

Care must be taken when using a spread spectrum clock generator (SSCG) with the PPC460EX. This controller uses a PLL for clock generation inside the chip. The accuracy with which the PLL follows the SSCG is referred to as *tracking skew*. The PLL bandwidth and phase angle determine how much tracking skew there is between the SSCG and the PLL for a given frequency deviation and modulation frequency. When using an SSCG with the PPC460EX the following conditions must be met:

- The frequency deviation must not violate the minimum clock cycle time. Therefore, when operating the PPC460EX with one or more internal clocks at their maximum supported frequency, the SSCG can only lower the frequency.
- The maximum frequency deviation of SysClk cannot exceed -1% , and the modulation frequency cannot exceed 40kHz. In some cases, on-board PPC460EX peripherals impose more stringent requirements.
- For the PCI Express Reference Clock, the maximum spread spectrum is -0.5% , modulated between 30kHz and 33kHz. The ports on the two ends of a link must transmit data at a rate that is within 600 parts per million (ppm) of each other at all times. This is specified to allow bit rate clock sources with a ± 300 ppm tolerance.

Notes:

1. The serial port baud rates are synchronous to the modulated clock. The serial port has a tolerance of approximately 1.5% on baud rate before framing errors begin to occur. The 1.5% tolerance assumes that the connected device is running at precise baud rates.
2. Ethernet operation is unaffected.
3. IIC operation is unaffected.

Important: It is up to the system designer to ensure that any SSCG used with the PPC460EX meets the above requirements and does not adversely affect other aspects of the system.

Table 20. Peripheral Interface Clock Timings (Part 1 of 2)

Parameter	Minimum	Maximum	Units	Notes
PCI0Clk frequency	–	66.66	MHz

USB2HClk period	16.66	16.66	ns	
USB2HClk high time	40% of nominal period	60% of nominal period	ns	
USB2HClk low time	40% of nominal period	60% of nominal period	ns	
USB2HClk48 frequency	48	48	MHz	
USB2HClk48 period	20.8	20.8	ns	
USB2HClk48 high time	40% of nominal period	60% of nominal period	ns	
USB2HClk48 low time	40% of nominal period	60% of nominal period	ns	

Notes:

1. T_{OPB} is the period in ns of the OPB clock. The minimum OPB clock frequency is Ethernet application dependant (see *Table 19* on page 82). The maximum OPB clock frequency is 100 MHz.
2. An internal PLL improves this duty cycle to a worst case of 48% minimum, 52% maximum.
3. TrcClk is 1/4 CPU Clk. The maximum TrcClk supported by most instruction trace probes is 200MHz.
4. The rise time for GMCRefClk is measured between 0.7V and 1.7V.

DDR2/1 SDRAM Interface Specifications

The DDR SDRAM controller times its operation using the internal PLB clock signal and generates MemClkOut from the PLB clock. The PLB clock is an internal signal that cannot be directly observed.

Note: MemClkOut can be advanced with respect to the PLB clock by means of the SDRAM0_CLKTR programming register. In a typical system, users advance MemClkOut by 90°. This depends on the specific application and requires a thorough understanding of the memory system in general (refer to the DDR SDRAM Controller chapter in the *PowerPC 460EX/EXr/GT Embedded Processor User's Manual*).

The signals are terminated as indicated in *Figure 8* for the DDR timing data in the following sections.

Programmable Timing

When initializing the DDR controller at boot time, calibration of various programmable delays is required. The following parameters are programmable:

- The internal delay of the DQS signals on a read is programmable. A single programmable delay globally affects all of the DQS signals.
- The internal delay of the feedback signal on a read is programmable. The DDR controller drives and receives a pulse at the beginning of each read burst. The feedback pulse is driven and received by MemDCFbdkD and MemDCFbdkR. This pulse is used to adjust the sample cycle.
- The phase between the internal PLB clock and MemClkOut is programmable.
- The phase between the MemClkOut and the write DM, DQS, and data signals is programmable.

Board Layout Recommendations

The paths (traces) for the data and the associated data strobe signal should be routed with the same length between PPC460EX and the SDRAM devices, allowing the rising and falling edges of the strobe to arrive at the capture logic at the same time the data is in transition. Board designs must meet of the following criteria:

- Skew between the signals within any byte lane (8 DQ, 1 DQS, and 1 DM) should not exceed 50ps.

For example, traces that average 3.00 in. and 167ps/in., and meet the maximum 50ps skew requirement, have a maximum length difference of 0.3in. and are between 2.85in. and 3.15in.

Clocking

Clocking skew to all DRAMs must be minimized. The maximum recommended flight-time skew between clocks for different memory chips is 10ps. Because of the stringent requirements on DDR device clock inputs, it is expected that board designers use some type of external PLL suitable to redrive the clock to the DDR SDRAMs when more than two memory clocks are needed.. In such a system, the PLL acts as a zero-delay insertion buffer.

The PPC460EX (PPC460GT) has two identical memory clocks, MemClkOut0:1, eliminating the need to redrive the memory clock for some board designs. Designs using a single registered DIMM or a single rank of directly attached 32-bit memory (2 x16 memory chips) does not require redriven clocks.

Feedback Signal

There are two options for handling the trace between the feedback driver and receiver, MemDCFbdkD to MemDCFbdkR.

1. The feedback trace can be length matched to the round-trip delay measured from the rising edge of MemClkOut0:1 to the resulting input DQS on a read operation. Matching the feedback trace to the round-trip delay, however, can negatively affect the sample cycle used by the DDR controller during reads. For this reason, matching the trace length is not recommended for typical applications. Even when trace lengths are matched to the round trip delay, software calibration of the feedback delay is still required.

2. The feedback trace can be made as short as possible such that MemDCFdbkD to MemDCFdbkR are directly connected to one another. When using a short trace, software must calibrate the feedback timing using MCIF0_RFDC[RFFD]. This method works well as long as the round trip flight time is less than half of a MemClkOut cycle.

DDR I/O Characteristics

The DDR I/O operate as either 2.5V (SSTL2_25) DDR1 or 1.8V (SSTL_18) DDR2 receiver/drivers. The following table lists the ODT termination supported, output driver impedance and input receiver capacitance.

Table 23. DDR I/O Characteristics

Signals	DDR2 ODT (Ω)	Output Impedance (Ω)	Input Capacitance (pF)
MemData00:63, ECC0:7, MemDCFdbkD, MemDCFdbkR, MemAddr00:14, BA0:2, BankSel0:3, RAS, CAS, WE, ClkEn0:3, DM0:8, MemODT0:3	75	36	6.4
DQS0:8/ $\overline{\text{DQS0:8}}$	75	18 or 36	6.4
MemClkOut0:1/ $\overline{\text{MemClkOut0:1}}$	–	18 or 36	6.4

Notes:

1. The output impedance (drive strength) for DQS0:8/ $\overline{\text{DQS0:8}}$ and MemClkOut0:1/ $\overline{\text{MemClkOut0:1}}$ is programmable.
2. The 75-ohm internal termination for MemData00:63, DQS0:8/ $\overline{\text{DQS0:8}}$, and DM0:8 can be statically or dynamically enabled.
3. The 75-ohm internal termination is statically enabled for MemDCFdbkD, MemDCFdbkR, MemAddr00:14, BA0:2, BankSel0:3, RAS, CAS, WE, ClkEn0:3, and MemODT0:3.

Table 24. DDR SDRAM Output Driver Specifications

Signal Path	Output Current (mA)	
	I/O H (maximum)	I/O L (maximum)
MemData00:63	10	10
ECC0:7	10	10
DM0:8	10	10
MemClkOut	10	10
MemAddr00:14	10	10

MemODT0:3	10	10

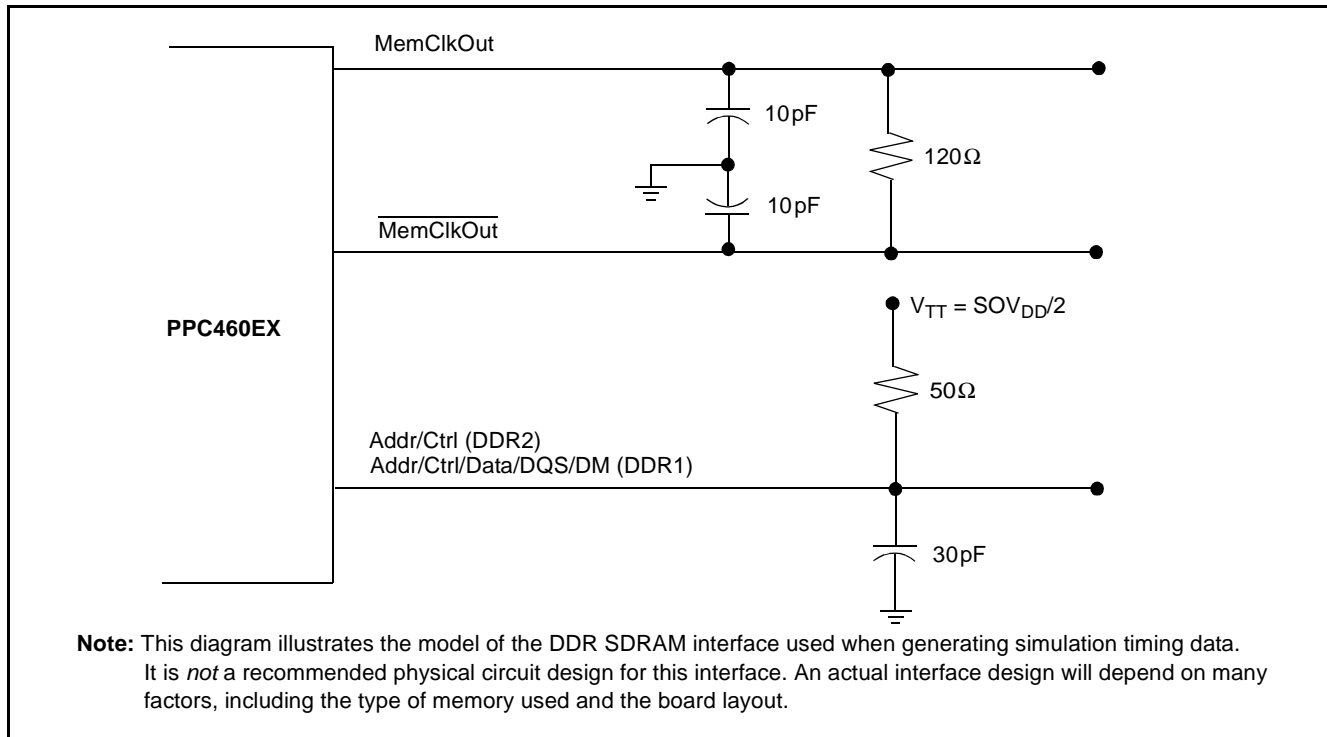

Preliminary Data Sheet**DDR SDRAM Timing Conditions**

The following timing values are generated by means of simulation and includes logic, driver, package RLC, and lengths. Values are calculated over best case and worst case processes with speed, junction temperature, and voltage as follows:

Table 25. DDR SDRAM Operation Conditions

Case	Process Speed	Case Temperature (°C)	SOV _{DD} for DDR1 (V)	SOV _{DD} for DDR2 (V)
Best	Fast	-40	+2.4	+1.9
Worst	Slow	+85	+2.6	+1.7

Figure 8. DDR SDRAM Simulation Signal Termination Model

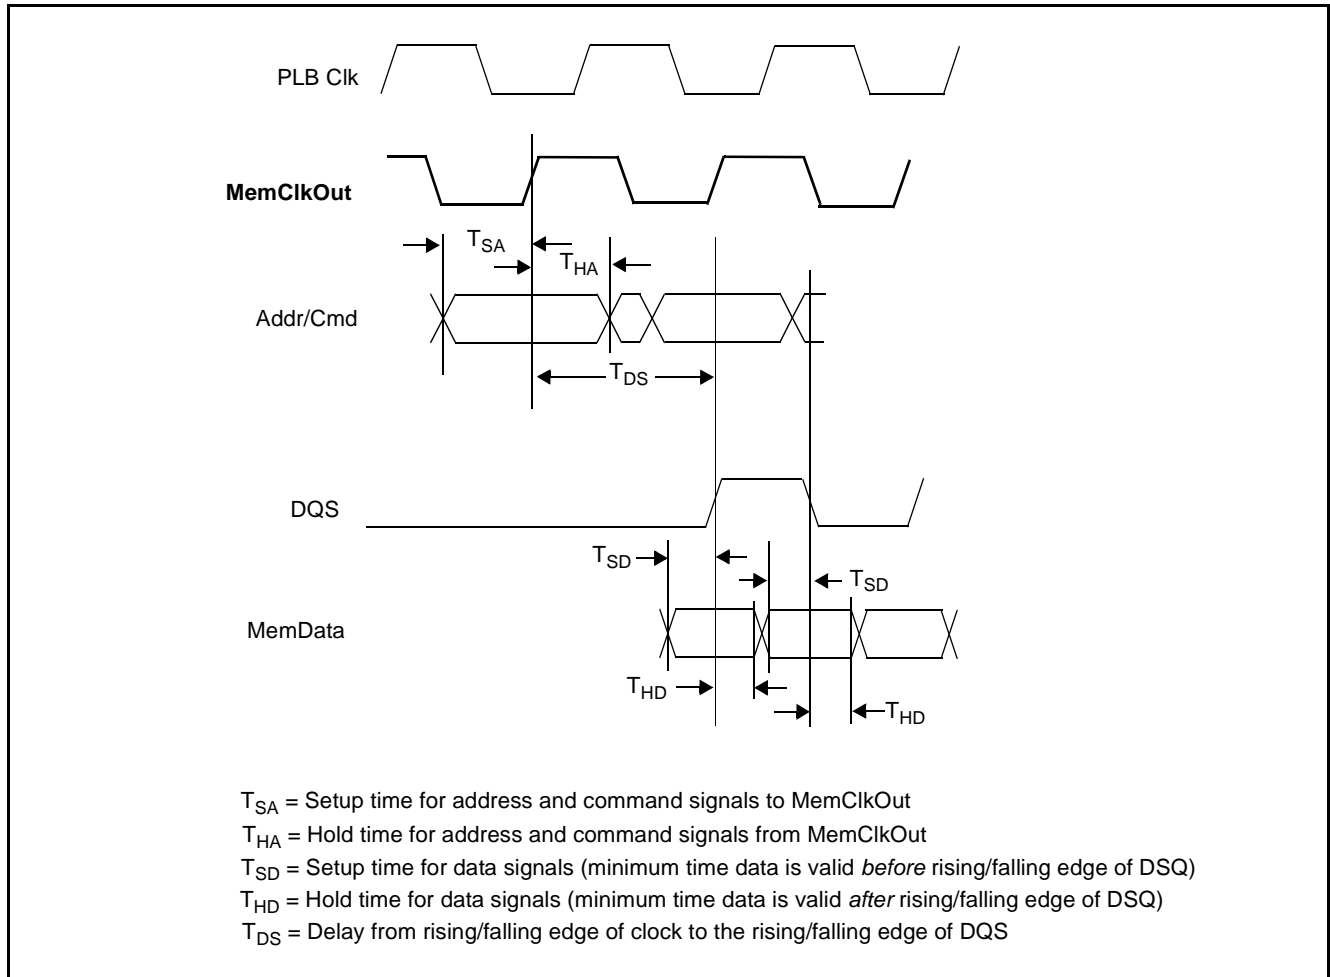

**DDR SDRAM Write Operation**

The rising edge of MemClkOut aligns with the first rising edge of the DQS signal on writes.

Note: In the following tables and timing diagrams, minimum values are measured under best case conditions and maximum values are measured under worst case conditions. The timing numbers in the following sections are obtained using a simulation that assumes a model as shown in *Figure 8*.

The following diagram illustrates the relationship among the signals involved with a DDR write operation.

Figure 9. DDR SDRAM Write Cycle Timing

Note: The timing data in the following tables is based on simulation runs using Einstimer.

Table 26. I/O Timing—DDR SDRAM T_{DS} for 200 MHz

Notes:

1. All of the DQS signals are referenced to MemClkOut.
2. MemClkOut frequency is 200MHz.

Signal Name	T_{DS} (ns)	
	Minimum	Maximum
DQS0:8/ DQS0:8	4.9	5.1

Preliminary Data SheetTable 27. I/O Timing—DDR SDRAM T_{SA} , and T_{HA} **Notes:**

1. The timing values in this table apply to MemClkOut frequency of 200MHz.
2. T_{SA} and T_{HA} are referenced to MemClkOut rising edge.
3. DDR1 is supported up to 200MHz. (400Mbps data rate).

Signal Name	T_{SA} (ns)	T_{HA} (ns)
	Minimum	Minimum
MemAddr00:14	1.08	1.18
BA0:2	1.17	1.19
BankSel0:3	1.12	1.15
ClkEn0:3	1.11	1.15
\overline{CAS}	1.16	1.14
\overline{RAS}	1.17	1.13
\overline{WE}	1.17	1.17

Table 28. I/O Timing—DDR SDRAM Write Timing T_{SD} and T_{HD} **Notes:**

1. T_{SD} and T_{HD} are measured under worst case conditions.
2. The timing values in this table apply to MemClkOut frequency of 200MHz.
3. The timing values in this table include 1/4 of a cycle at 200MHz.
4. To obtain adjusted T_{SD} and T_{HD} values for clock frequencies less than 200MHz, subtract 1.5ns from the values in the table and add 1/4 of the cycle time for the lower clock frequency (for example, $T_{SD} - 1.5 + 0.25T_{CYC}$).
5. DDR1 is supported up to 200MHz. (400Mbps data rate).

Signal Names	Reference Signal	T_{SD} (ns)	T_{HD} (ns)
MemData00:07, DM0	DQS0	0.96	0.995
MemData08:15, DM1	DQS1	0.97	0.990
MemData16:23, DM2	DQS2	0.98	0.980
MemData24:31, DM3	DQS3	0.98	0.980
MemData32:39, DM4	DQS4	0.98	0.980
MemData40:47, DM5	DQS5	0.97	0.983
MemData48:55, DM6	DQS6	0.96	0.982
MemData56:63, DM7	DQS7	0.96	0.985
ECC0:7, DM8	DQS8	0.96	0.980

DDR SDRAM Read Operation

The read of the incoming data from the SDRAM is done on the rising and falling edges of the differential DQS signal. The data must be centered to these edges for correct operation.

DDR SDRAM Read Cycle Timing

The following diagram illustrates the relationship of the signals involved with a DDR read operation.

Figure 10. DDR SDRAM Memory Data and DQS

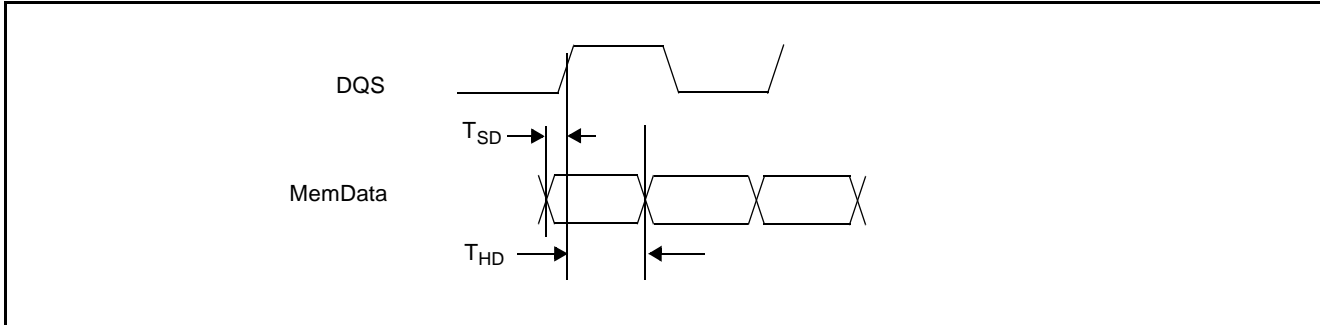

Table 29. I/O Timing—DDR SDRAM Read Timing T_{SD} and T_{HD} for 200MHz

1. T_{SD} and T_{HD} are measured under worst case conditions.
2. MemClkOut frequency is 200MHz.
3. The time values in this table include 1/4 of a cycle at 200MHz (5ns x 0.25 = 1.25ns).
4. To obtain adjusted T_{SD} and T_{HD} values for lower clock frequencies, subtract 0.75ns from the values in the table and add 1/4 of the cycle time for the lower clock frequency (e.g., $T_{SD} - 1.25 + 0.25T_{CYC}$).
5. DDR1 is supported up to 200MHz. (400Mbps data rate).

Signal Names	Reference Signal	Read Data vs DQS Set up T_{SD} (ns)	Read Data vs DQS Hold T_{HD} (ns)
MemData00:07	DQS0	0.393	0.311
MemData08:15	DQS1	0.388	0.314
MemData16:23	DQS2	0.397	0.307
MemData24:31	DQS3	0.396	0.309
MemData32:39	DQS4	0.394	0.291
MemData40:47	DQS5	0.395	0.291
MemData48:55	DQS6	0.393	0.295
MemData56:63	DQS7	0.394	0.308
ECC0:7	DQS8	0.389	0.306

Preliminary Data Sheet**PCI Express Interface Specification**

The following tables contain the PCI Express interface specification.

Table 30. PCI Express Transmitter Specification

Parameter	Minimum	Maximum	Units	Notes
Unit Interval (UI)	400	400	ps	
Differential Tx peak-to-peak voltage swing	800	1200	mV ppd	
Low power differential Tx peak-to-peak voltage swing	400	–	mV ppd	
Tx de-emphasis level ratio	–3.0	–4.0	dB	
Minimum Tx eye width	0.75	–	UI	
Maximum time between the jitter median and maximum deviation from the median	–	0.125	UI	
Transmitter rise and fall time	0.125	–	UI	
Maximum Tx PLL bandwidth	–	22	MHz	
Minimum Tx PLL BW for 3dB peaking	1.5	–	MHz	
PCIEnTx/PCIEnTx Tx output rise/fall time	50	–	ps	
Tx AC common mode voltage	–	20	mV	
Absolute delta of DC common mode voltage during L0 and Electrical Idle	0	100	mV	
Absolute delta of DC common mode voltage between PCIEnTx and PCIEnTx	0	25	mV	
Electrical Idle differential peak output voltage	0	20	mV	
Amount of voltage change allowed during receiver detection	–	600	mV	
Tx DC common mode voltage	0	3600	mV	
Tx short-circuit current limit	–	90	mA	
Minimum time spent in Electrical Idle	50	–	UI	
Maximum time to transition to a valid Electrical Idle after sending an Electrical Idle Ordered-Set	–	20	UI	
Maximum transition time to valid differential signaling after leaving Electrical Idle	–	20	UI	
Tx differential return loss	–10	–	dB	
Tx common mode return loss	–6	–	dB	
Tx DC differential impedance	80	120	Ω	
Lane-to-Lane output skew	–	1300	ps	

Table 31. PCI Express Receiver Specification

Parameter	Minimum	Maximum	Units	Notes
Unit Interval (UI)	400	400	ps	
Frequency offset between transmit and receive clocks	-300	+300	ppm	
Differential Rx peak-to-peak voltage	175	1200	mV	
Rx AC common mode voltage	-	150	mV	
Receiver eye time opening	0.4	-	UI	
Maximum time delta between median and deviation from median	-	0.3	UI	
Total jitter tolerance	0.6	-	UI	
Rx differential return loss	-10	-	dB	
Rx common mode return loss	-6	-	dB	
Rx DC differential impedance	80	120	Ω	
Rx DC common mode impedance	40	60	Ω	
Rx DC common mode impedance during reset or power down	200	-	k Ω	
Electrical Idle detect threshold	65	175	mV	
Unexpected Electrical Idle enter detect threshold integration time	-	10	ms	
Lane-to-Lane output skew	-	20	ns	

Table 32. PCI Express Reference Clock Specification

Parameter	Minimum	Maximum	Units	Notes
Reference clock frequency	100	100	MHz	1
Accuracy	-300	+300	ppm	
Duty cycle	45	55	%	
Peak-to-peak jitter for 1E-6 BER (1×10^{-6} bit error rate)	-	86	ps	3
Peak-to-peak jitter for 1E-12 BER (1×10^{-12} bit error rate)	-	108	ps	3
Spread Spectrum Clock (SSC) frequency	30	33	kHz	2
Differential signal amplitude	200	1600	mV	

Notes:

1. The reference clock frequency specification does not include ± 300 ppm frequency offset specification.
2. The data rate can be modulated from +0% to -0.5% of the nominal data rate frequency, at a modulation rate in the range not exceeding 30kHz-33kHz. The ± 300 ppm requirement remains which requires the two communicating ports to be modulated so that they never exceed a total of 600ppm difference. For most implementations, this requires that both ports have the same bit rate clock source when the data is modulated with an SSC.
3. 1E-6 is the probability that the jitter is greater than 86ps peak-to-peak. 1E-12 is the probability that the jitter is greater than 108ps peak-to-peak.

Preliminary Data Sheet**Serial ATA (SATA) Interface Specification**

The following tables contain the SATA interface specification.

Table 33. SATA Transmitter Specification

Parameter	Minimum	Maximum	Units	Notes
Unit Interval (UI)	333.3	666.6	ps	
Differential Tx peak-to-peak voltage swing	400	1600	mV ppd	
SATA0Tx/SATA0Tx Tx output rise/fall time	67	–	ps	
Tx short-circuit current limit	–	90	mA	
Tx differential return loss	–10	–	dB	
Tx common mode return loss	–6	–	dB	
Tx DC differential impedance	85	115	Ω	
Tx DC single-ended impedance	40	–	Ω	
Tx OOB transmission voltage	–	200	mV ppd	

Table 34. SATA Receiver Specification

Parameter	Minimum	Maximum	Units	Notes
Unit Interval (UI)	333.3	666.6	ps	
Frequency offset between transmit and receive clocks	–5350	+350	ppm	
Differential Rx peak-to-peak voltage	240	–	mV	
Total jitter tolerance	0.65	–	UI	
Rx differential return loss	–10	–	dB	
Rx common mode return loss	–6	–	dB	
Rx DC differential impedance	85	115	Ω	
Rx DC common mode impedance	40	–	Ω	
Rx OOB voltage detection threshold	–	240	mV	

Table 35. SATA Reference Clock Specification

Parameter	Minimum	Maximum	Units	Notes
Reference clock frequency	100	120	MHz	1, 3
Accuracy	–350	+350	ppm	
Duty cycle	45	55	%	
Cycle-to-cycle jitter	–	150	ps p-p	
Total jitter 1kHz–1MHz	–	100	ps p-p	
Total jitter 1MHz–20MHz	–	40	ps p-p	
Total jitter >20MHz	–	100	ps p-p	
Spread Spectrum Clock (SSC) frequency	30	33	kHz	2
Spread Spectrum Clock (SSC) variation	0	5000	ppm	2

Notes:

1. The reference clock frequency specification does not include 5700ppm frequency offset specification.
2. The data rate can be modulated from +0% to –0.5% of the nominal data rate frequency, at a modulation rate in the range not exceeding 30kHz–33kHz. The ± 350 ppm requirement remains which requires the two communicating ports to be modulated so that they never exceed a total of 700ppm difference. For most implementations, this requires that both ports have the same bit rate clock source when the data is modulated with an SSC.
3. Only 100MHz or 120MHz is supported.

PCI-E and SATA Reference Clock AC Coupling Recommendations

AC coupling is recommended for the PCIe and SATA reference clock. The following figures illustrate how to implement AC coupling for the most common differential reference clocks.

Note: C1 and C2 may be any value from 0.01µF to 0.1µF as long as C1 equals C2. All components should be in a 0603 or smaller package and should be placed to minimize the stub length to the traces.

Figure 11. LVDS PCIe or SATA Reference Clock

Preliminary Data Sheet

Figure 13. CML PCIe or SATA Reference Clock

Figure 14. HCSL PCIe or SATA Reference Clock

Boot Configuration

The PPC460EX supports several configurable boot parameters that must be initialized prior to booting. These parameters are configured by one of several default boot options or programmed by data read from an IIC serial EEPROM (see “Serial EEPROM” below). Strap signals sampled during reset select which method is used to initialize the boot parameters (see “Strapping” below).

Strapping

The Bootstrap Controller selects the boot options based on the state of the strap signals during reset. The strap signals are sampled on the rising edge of SysClk while SysReset is driven low. They must not change state until after SysReset is driven high in order to guarantee the correct boot option is selected.

These pins are used for strap functions only during reset. Following reset, they are used for normal functions. The signal names assigned to the pins for normal operation are shown in parentheses following the pin number.

The following table lists the strapping pins along with their functions and boot strap options:

Table 36. Strapping Pin Assignments

Function	Boot Option	Strapping Pins		
		E31 ($\overline{\text{UART0CTS}}$)	E34 ($\overline{\text{UART0DCD}}$)	E32 ($\overline{\text{UART0DSR}}$)
Serial device is disabled. Each of the six options (A–F) is a combination of boot source, boot-source width, and clock frequency specifications. Refer to the <i>PPC460EX Embedded Processor User's Manual</i> for details.	A	0	0	0
	B	0	0	1
	C	0	1	0
	D	0	1	1
	E	1	0	0
	F	1	0	1
Serial device is enabled. Boot Option G and H enable the Bootstrap Controller to program boot parameters using data read from an IIC serial EEPROM. Option G and H support different IIC addresses.	G (0xA8)	1	1	0
	H (0xA4)	1	1	1

Serial EEPROM

Boot Options G and H enable the Bootstrap Controller to read 16 bytes of configuration data from a serial EEPROM attached to the IIC0 bus after SysReset deasserts. The Bootstrap Controller stores the data in the SDR0_SDSTP0:3 registers.

Note: The IIC serial EEPROM must have a one-byte base address. Multi-byte base addresses are not supported.

The initialization settings and their default values are covered in detail in the *PowerPC 460EX/EXr/GT Embedded Processor User's Manual User's Manual*.

Preliminary Data Sheet**Revision Log**

Date	Version	Contents of Modification
04/20/2007	1.00	Initial creation of document.
05/17/2007	1.00	Update to initial creation of document.
07/18/2007	1.01	Update to initial creation of document.
08/03/2007	1.02	Update to initial creation of document. Eliminate SRIO, EMB, second RGMII, SMII, third and fourth EMACs.
10/01/2007	1.03	Change GPIOs to alternate to default signals. Add thermal monitor diagram. Corrected signal-to-pin (ball) assignments for nine pins. Misc. updates and corrections.
10/17/2007	1.04	Change all occurrences of PerDataPar to PerPar. Swap signals assigned to balls A20 and E19. Add updates from 460EX development which include changing the nine signal-to-pin changes made for 1.03 back to their original state. Restore TBI and RTBI to Features on first page. Correct ActiveLow indication on some SATA and PCIE signals.
10/18/2007	1.05	Correct ActiveLow indication on some SATA and PCIE signals. Remove all GMC1xxxx signals. Remove all TBI and RTBI signals.
12/21/2007	1.06	Add missing GMC1RxCtl signal to pin AJ10. Update I/O timing. Change PCIE calibration resistor from 1k to 1.37k. Add RMII signals.
01/14/2008	1.07	Misc. updates. Change maximum case temperature from +105°C to +85°C.
02/11/2008	1.08	Correct typographical errors. Correct DDR SDRAM Read Data Path diagram. Update PCIE _n RefClk signal description.
04/14/2008	1.09	Add block diagram from R/C engineering specification. Reference 802.3 Ethernet spec for GMCMDDIO timing. Add KASUMI support to security. Change document status from Advanced to Preliminary and remove Confidential status. Update block diagram. Add power estimates. Flag SGMIIRefClk signals as not to be used. Update Contents to include L2 Cache/SRAM.
05/05/2008	1.10	Delete SAV _{DD} voltage from analog voltage filter diagram (Doc Issue 503). Change Thermal Monitor parameters (Doc Issue 504). Misc. changes including Doc Issues 512, 524, and 526.
05/29/2008	1.11	Doc Issue 455. Add power sequence information.
07/17/2008	1.12	Doc Issues 530, 532, 536, 550. Update JTAG timing.

Date	Version	Contents of Modification
09/26/2008	1.13	<p>Doc Issue 572. Update <u>SysReset</u> signal functional description. Security is no longer optional. Remove non-security part numbers.</p> <p>Doc Issue 589. PCI-E and SATA I/O specifications. Timing, power, and other misc. updates. New RGMII wave forms.</p> <p>Update Security features list.</p> <p>Doc Issue 595. Add pull-up and pull-down resistor values. Additional processor speed of 1.066GHz. New power values for 1.066GHz and lower speeds. Change bootstrap description.</p>
11/14/2008	1.14	<p>Doc Issue 4816. Change SysReset I/O designation.</p> <p>Doc Issue 4892. PCI clock required even when PCI is unused</p> <p>Doc Issue 4933. Change SATARefClk frequency range.</p> <p>Doc Issue 4960. Remove all references to SMII and RMII.</p> <p>Doc Issue 5031. PCI signal termination recommendation.</p> <p>Doc Issue 5032. Change PCI Express reference clock to 100MHz .</p> <p>Doc Issue 5045. Remove length constraint from DDR layout recommendation .</p> <p>Doc Issue 5205. Correct SysReset signal description.</p>
12/18/2008	1.15	For Rev.A parts, removed 1066MHz CPU and 266MHz PLB/Memclk.
1/16/2009	1.16	<p>Doc Issue 5220:</p> <ul style="list-style-type: none"> • In Table 9, updated description for <u>SysReset</u>; changed “32 cycles” to “32 SysClk cycles”. <p>Doc Issue 5440:</p> <ul style="list-style-type: none"> • In Table 19, updated OPB Clock minimum frequency and maximum period, and added note. • In Table 20, updated SPIClkOut minimum and maximum frequency, and updated Note 1.
2/27/2009	1.17	<p>Added Revision B, Rev.B PVR, and No Security part number. Marked security as optional. Clarified signal names in Table 24, Table 26, and Table 27.</p> <p>Doc Issue 5857:</p> <ul style="list-style-type: none"> • In Table 19, added notes regarding SysClk jitter and slew rate. <p>Doc Issue 5885:</p> <ul style="list-style-type: none"> • In Table 23, corrected errors: All of the signals with the exception of the MemClkOut signals have 75-ohm internal termination. <p>Doc Issue 5973:</p> <ul style="list-style-type: none"> • In Table 19, added note indicating the spread spectrum modulation range when SysClk is 66.66MHz.
4/30/09	1.18	<p>Updated Table 17, <i>DC Power Supply Loads</i>.</p> <p>Doc Issue 6180:</p> <ul style="list-style-type: none"> • Added requirement for AC coupling on PCIEnRefClk and SATA0RefClk in Table 9. • Added section “PCI-E and SATA Reference Clock AC Coupling Recommendations” on page 100. <p>Doc Issue 6361:</p> <ul style="list-style-type: none"> • Changed CGM to GCM under “Security Function (Optional)” on page 13.
6/17/09	1.19	<p>Removed iSCSI CRC32 function from I2O/DMA.</p> <p>Added FSOURCE0 to signal list. This signal should be tied to ground if the SDR0_ECID0:3 (electronic chip ID) registers need to be read.</p> <p>Updated GMCMDIO T_{OV} specification.</p>

Preliminary Edition (June 17, 2009)

This document contains information on a new product under development by AMCC.

AMCC reserves the right to change or discontinue this product without notice.

This document is a preliminary edition of the PowerPC 460EX data sheet. Make sure you are using the correct edition for the level of the product.

While the information contained herein is believed to be accurate, such information is preliminary, and should not be relied upon for accuracy or completeness, and no representations or warranties of accuracy or completeness are made.

The information contained in this document is subject to change or withdrawal at any time without notice and is being provided on an "AS IS" basis without warranty or indemnity of any kind, whether express or implied, including without limitation, the implied warranties of non-infringement, merchantability, or fitness for a particular purpose. Any products, services, or programs discussed in this document are sold or licensed under AMCC's standard terms and conditions, copies of which may be obtained from your local AMCC representative. Nothing in this document shall operate as an expressed or implied license or indemnity under the intellectual property rights of AMCC or third parties.

Without limiting the generality of the foregoing, any performance data contained in this document was determined in a specific or controlled environment and not submitted to any formal AMCC test. Therefore, the results obtained in other operating environments may vary significantly. Under no circumstances will AMCC be liable for any damages whatsoever arising out of or resulting from any use of the document or the information contained herein.
