World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

ADVANCED COMMUNICATIONS & SENSING

SX1507/SX1508/SX1509

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

GENERAL DESCRIPTION

The SX1507, SX1508 and SX1509 are complete ultra low voltage 1.2V to 3.6V General Purpose parallel Input/Output (GPIO) expanders ideal for low power handheld battery powered equipment. This family of GPIOs comes in 4-, 8-, 16-channel configuration and allows easy serial expansion of I/O through a standard 400kHz I²C interface. GPIO devices can provide additional control and monitoring when the microcontroller or chipset has insufficient I/O ports, or in systems where serial communication and control from a remote location is advantageous.

These devices can also act as a level shifter to connect a microcontroller running at one voltage level to a component running at a different voltage level, thus eliminating the need for extra level translating circuits. The core is operating as low as 1.425V while the dual I/O banks can operate between 1.2V and 3.6V independent of the core voltage and each other (5.5V tolerant).

The SX1507, SX1508 and SX1509 feature a fully programmable LED Driver with internal oscillator for enhanced lighting control such as intensity (via 256-step PWM), blinking and breathing (fade in/out) make them highly versatile for a wide range of LED applications.

In addition, keypad application is also supported with the on-chip scanning engine which enables continuous keypad monitoring up to 64 keys without any additional host interaction and further reduce the bus activity.

The SX1507, SX1508 and SX1509 have the ability to generate mask-programmable interrupts based on falling/rising edge of any of its GPIO lines. A dedicated pin indicates to a host controller that a state change occurred in one or more of the lines. Each GPIO is programmable via 8-bit configuration registers such as data registers, direction registers, pull-up/pull-down registers, interrupt mask registers and interrupt registers. These I/O expanders come in small footprint packages and are rated from -40°C to +85°C temperature range.

ORDERING INFORMATION

Part Number	I/O Channels	Package
SX1507XXX ⁽¹⁾	4	QFN-UT-14
SX1508IULTRT	8	QFN-UT-20
SX1509IULTRT	16	QFN-UT-28

SX1509EVK	16	Evaluation Kit

⁽¹⁾ Future product

KEY PRODUCT FEATURES

- 1.2V to 3.6V Low Operating Voltage with Dual Independent I/O Rails (VCC1, VCC2)
 - Enable Direct Level Shifting Between I/O Banks and Host Controller
- 5.5V Tolerant I/Os, Up to 15mA Output Sink on All I/Os (No Total Sink Current Limit)
- Integrated LED Driver for Enhanced Lighting
 - Intensity Control (256-step PWM)
 - Blink Control (224 On/Off values)
 - Breathing Control (224 Fade In/Out values)
- On-Chip Keypad Scanning Engine
 - Support Up to 8x8 Matrix (64 Keys)
 - Configurable Input Debouncer
- 4/8/16 Channels of True Bi-directional Style I/O
 - Programmable Pull-up/Pull-down
 - Push/Pull or Open-drain outputs
 - Programmable Polarity
- Open Drain Active Low Interrupt Output (NINT)
 - Bit Maskable
 - Programmable Edge Sensitivity
- Built-in Clock Management (Internal 2MHz Oscillator/External Clock Input, 7 clock values)
 - OSCIO can be Configured as GPO
- 400kHz I²C Compatible Slave Interface
- 4 User-Selectable I2C Slave Addresses
- Power-On Reset and Reset Input (NRESET)
- Ultra Low Current Consumption of typ. 1uA
- -40℃ to +85℃ Operating Temperature Range
- 2kV HBM ESD Protection
- Small Footprint Packages
- Pb & Halogen Free, RoHS/WEEE compliant

TYPICAL APPLICATIONS

- · Cell phones, PDAs, MP3 players
- Digital camera, Notebooks, GPS Units
- Any battery powered equipment

2 ELECTRICAL CHARACTERISTICS

2.1 Absolute Maximum Ratings

Table below applies to SX1508 and SX1509. Stress above the limits listed in the following table may cause permanent failure. Exposure to absolute ratings for extended time periods may affect device reliability. The limiting values are in accordance with the Absolute Maximum Rating System (IEC 134). All voltages are referenced to ground (GND).

Symbol	Description	Min	Max	Unit
V_{max_VDDM}	Main supply voltage	- 0.4	3.7	V
V _{max_VCC1-2}	Digital I/O pin supply voltage	- 0.4	3.7	V
V	Electrostatic handling HBM model ⁽¹⁾ (SX1508)	-	2000	V
V _{ES_HBM}	Electrostatic handling HBM model ⁽¹⁾ (SX1509)	-	1500	V
V_{ES_CDM}	Electrostatic handling CDM model	-	1000	V
V	Electrostatic handling MM model (SX1508)	-	200	V
V _{ES_MM}	Electrostatic handling MM model (SX1509)	-	150	V
T _A	Operating ambient temperature range	-40	+85	$\mathcal C$
T _C	Junction temperature range	-40	+125	${\mathbb C}$
T _{STG}	Storage temperature range	-55	+150	$\mathcal C$
I _{lat}	Latchup-free input pin current ⁽²⁾	+/-100	-	mΑ

⁽¹⁾ Tested according to JESD22-A114A

Table 5 - Absolute Maximum Ratings

2.2 Electrical Specifications

Table below applies to SX1508 and SX1509 with default registers values, unless otherwise specified. Typical values are given for $T_A = +25$ °C, VDDM=VCC1=VCC2=3.3V.

fosc	Oscillator frequency	External from OSCIN	-	-	2.6	IVIIIZ

⁽¹⁾ Assuming no load connected to outputs and inputs fixed to VCC1,2 or GND.

Table 6 – Electrical Specifications

 ⁽²⁾ Can be increased by tying together and driving simultaneously several I/Os.
 (3) All values referred to VIH_{MR min} and VIL_{M max} levels.
 (4) A device must internally provide a hold time of at least 300ns for the SDA signal (referred to VIH_{MR min}) to bridge the undefined region of the falling edge of SCL.

⁽⁵⁾ The maximum t_{HD:DAT} has only to be met if the device does not stretch the LOW period (t_{LOW}) of the SCL signal.

⁽⁶⁾ A Fast-mode l²C-bus device can be used in a Standard-mode l²C-bus system, but the requirement t_{SU;DAT} ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal.

If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_{r max}+ t_{SU:DAT} = 1000 + 250 = 1250 ns (according to the Standard-mode I2C-bus specification) before the SCL line is released.

⁽⁷⁾ C_b = total capacitance of one bus line in pF. If mixed with Hs-mode devices, faster fall-times are allowed. (8) With RegHighInput bit enabled (VCCx min =1.65V), else 3.6V (VCCx min = 1.2V)

4.4 Reset

4.4.1 Hardware (NRESET)

The SX1507, SX1508 and SX1509 generate their own power on reset signal after a power supply is connected to the VDDM pin. The reset signal is made available for the user at the pin NRESET. The rising edge of the NRESET indicates that the startup sequence of the SX1507, SX1508 or SX1509 has finished. NRESET must be connected to VDDM (or greater) either directly, or via a resistor.

Figure 7 - Power-On / Brown-out Reset Conditions

- 1. Device behavior is undefined until VDDM rises above VPOR, at which point NRESET is driven to GND by the SX1507, SX1508 or SX1509.
- 2. After t_{RESET} , NRESET is released (high-impedance) by the SX1507, SX1508 or SX1509 to allow it to be pulled high by an external resistor.

Rev $1 - 30^{th}$ Oct. 2009 13 www.semtech.com

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

ADVANCED COMMUNICATIONS & SENSING

- 3. In operation, the SX1507, SX1508 and SX1509 may be reset (POR like or LED driver counters only depending on RegMisc setting) at anytime by an external device driving NRESET low during t_{PULSE}. Chip can be accessed normally again after NRESET rising edge.
- 4. During a brown-out event, if VDDM drops above VDROPH a reset will not occur.
- 5. During a brown-out event, if VDDM drops between VDROPH and VDROPL a reset may occur.
- 6. During a brown-out event, if VDDM drops below VDROPL a reset will occur next time VPOR is crossed.

Please note that a brown-out event is defined as a transient event on VDDM. If VDDM is attached to a battery, then the gradual decay of the battery voltage will not be interpreted as a brown-out event. Please also note that a sharp rise in VDDM (> 1V/us) may induce a circuit reset.

4.4.2 Software (RegReset)

Writing consecutively 0x12 and 0x34 to RegReset register will reset all registers to their default values.

4.5 2-Wire Interface (I²C)

The SX1507, SX1508 and SX1509 2-wire interface operates only in slave mode. In this configuration, the device has one or 4 possible devices addresses defined by ADDR[1:0] pins:

Device	ADDR[1:0]	Address	Description
	00	0x2 0 (01000 00)	First address of the 2-wire interface
SX1508	01	0x2 1 (01000 01)	Second address of the 2-wire interface
371300	10	0x2 2 (01000 10)	Third address of the 2-wire interface
	11	0x2 3 (01000 11)	Fourth address of the 2-wire interface
	00	0x3E (0 11111 0)	First address of the 2-wire interface
SX1507 &	01	0x3F (0 11111 1)	Second address of the 2-wire interface
SX1509	10	0x70 (1 11000 0)	Third address of the 2-wire interface
	11	0x71 (1 11000 1)	Fourth address of the 2-wire interface

Table 7 - 2-Wire Interface Address

2 lines are used to exchange data between an external master host and the slave device:

SCL : Serial CLockSDA : Serial DAta

The SX1507, SX1508 and SX1509 are read-write slave-mode I^2C devices and comply with the Philips I^2C standard Version 2.1 dated January, 2000. The SX1507, SX1508 and SX1509 have a few user-accessible internal 8-bits registers to set the various parameters of operation (Cf. §5 for detailed configuration registers description). The I^2C interface has been designed for program flexibility, in that once the slave address has been sent to the SX1507, SX1508 or SX1509 enabling it to be a slave transmitter/receiver, any register can be written or read independently of each other. The start and stop commands frame the data-packet and the repeat start condition is allowed if necessary.

Seven bit addressing is used and ten bit addressing is not allowed. Any general call address will be ignored by the SX1507, SX1508 and SX1509. The SX1507, SX1508 and SX1509 are not CBUS compatible and can operate in standard mode (100kbit/s) or fast mode (400kbit/s).

4.5.1 WRITE

After the start condition [S], the slave address (SA) is sent, followed by an eighth bit ('0') indicating a Write. The slave then Acknowledges [A] that it is being addressed, and the Master sends an 8 bit Data Byte consisting of the slave Register Address (RA). The Slave Acknowledges [A] and the master sends the appropriate 8 bit Data Byte (WD0). Again the slave Acknowledges [A]. In case the master needs to write more data, a succeeding 8 bit Data Byte will follow (WD1), acknowledged by the slave [A]. This sequence will be repeated until the master terminates the transfer with the Stop condition [P].

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

ADVANCED COMMUNICATIONS & SENSING

Figure 8 - 2-Wire Serial Interface, Write Operation

When successive register data (WD1...WDn) is supplied by the master, the register address can be automatically incremented or kept fixed depending on the setting programmed in RegMisc.

Figure 9 – Example: Write RegData Register

4.5.2 READ

After the start condition [S], the slave address (SA) is sent, followed by an eighth bit ('0') indicating a Write. The slave then Acknowledges [A] that it is being addressed, and the Master responds with an 8 bit Data consisting of the Register Address (RA). The slave Acknowledges [A] and the master sends the Repeated Start Condition [Sr]. Once again, the slave address (SA) is sent, followed by an eighth bit ('1') indicating a Read.

The slave responds with an Acknowledge [A] and the read Data byte (RD0). If the master needs to read more data it will acknowledge [A] and the slave will send the next read byte (RD1). This sequence can be repeated until the master terminates with a NACK [N] followed by a stop [P].

Figure 10 - 2-Wire Serial Interface, Read Operation

When successive register data (RD1...RDn) is read by the master, the register address will be automatically incremented or kept fixed depending on the setting programmed in RegMisc.

4.6 I/O Banks

4.6.1 Input Debouncer

Each input can be individually debounced by setting corresponding bits in RegDebounce register. At power up the debounce function is disabled. After enabling the debouncer, the change of the input value is accepted only if the input value is identical at two consecutive sampling times.

Rev 1 – 30th Oct. 2009 15 www.semtech.com

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

ADVANCED COMMUNICATIONS & SENSING

The debounce time common to all IOs can be set in RegDebounceConfig register from 0.5 to 64ms (fOSC = 2MHz).

4.6.2 Keypad Scanning Engine

SX1508, and SX1509 integrate a fully programmable keypad scanning engine to implement keypad applications up to 8x8 matrix (i.e. 64 keys).

Please note that SX1509 also implements an Auto Sleep/Wakeup feature to save power consumption when no key has been pressed for a programmed time.

Figure 11 – 4x4 Keypad Connection to SX1508

Following procedure should be implemented on the host controller for a 4x4 keypad:

- 1. Set RegDir to 0xF0 (IO[3-0] as outputs, IO[7-4] as inputs), set RegOpenDrain to 0x0F (IO[3-0] as open-drain outputs), set RegPullup to 0xF0 (pull-ups enabled on inputs IO[7-4]).
- 2. Enable and configure debouncing on IO[7-4] (RegDebounceEnable = 0xF0, Ex: RegDebounceConfig = 0x05)
- 3. Enable and configure keypad scanning engine (Ex: RegKeyConfig = 0x7D) This will start an infinite loop with the following sequence to IO[3:0]: ZZZ0, ZZ0Z, Z0ZZ, 0ZZZ. Make sure that scan interval is set to higher value than the debounce time.
- 4. When a key is pressed, NINT goes low, key scan is halted and the key coordinates are stored in RegKeyData:
 - The column data will be stored in RegKeyData[7:4] (Note: column indication is active low)
 - The row data will be stored in RegKeyData[3:0] (Note: row indication is active low)
 - When RegKeyData is read, this data along with the interrupt is automatically cleared (same behavior as reading RegData) and the key scan continues to the next row.
- 5. Restart from point 4.

This implementation allows the host to handle both single and multi-touches easily (fast AAAAAA sequence is a long press of key A, fast ABABABAB sequence is key A and key B pressed together, etc)

4.6.3 Level Shifter

Because of their 5.5V tolerant I/O banks with independent supply voltages between 1.2V and 3.6V, the SX1508 and SX1509 can perform level shifting of signals from one I/O bank to another **without uC activity** by programming the corresponding configuration register bits accordingly in RegLevelShifter (and RegDir). This can save significant BOM cost in a final application where only a few signals need to be level-shifted (no need for an additional external level shifter IC).

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

ADVANCED COMMUNICATIONS & SENSING

Figure 12 - Level Shifting Example

The minimum pulse width tLevelShiftMin which can be level shifted properly depends on VCCx and VDDM:

tLevelShiftMin = Input Delay + Core Delay + Output Delay

Input/Core/Output delays vs VCCx/VDDM are given in figures below.

ADVANCED COMMUNICATIONS & SENSING

4.6.4 Polarity Inverter

Each IO's polarity can be individually inverted by setting corresponding bit in RegPolarity register. Please note that polarity inversion can also be combined with level shifting feature.

4.7 Interrupt (NINT)

At start-up, the transition detection logic is reset, and NINT is released to a high-impedance state. The interrupt mask register is set to 0xFF, disabling the interrupt output for transitions on all I/O ports. The transition flags are cleared to indicate no data changes.

An interrupt NINT can be generated on any programmed combination of I/Os rising and/or falling edges through the RegInterruptMask and RegSense registers.

If needed, the I/Os which triggered the interrupt can then be identified by reading RegInterruptSource register.

When NINT is low (i.e. interrupt occurred), it can be reset back high (i.e. cleared) by writing 0xFF in RegInterruptSource (this will also clear corresponding bits in RegEventStatus register).

The interrupt can also be cleared automatically when reading RegData register (Cf. RegMisc)

Example: We want to detect rising edge of I/O[1] on SX1508 (NINT will go low).

- 1. We enable interrupt on I/O[1] in RegInterruptMask
- ⇒ RegInterruptMask ="XXXXXXX0X"
- 2. We set edge sense for I/O[1] in RegSense
- ⇒ RegSenseLow ="XXXX01XX"

Please note that independently from the "user defined" process described above the keypad engine, when enabled, also uses NINT to indicate a key press.

Hence we have NINT = "user defined condition occurred" OR "keypad engine condition occurred".

4.8 Clock Management

A main oscillator clock fOSC is needed by the LED driver, keypad engine and debounce features.

Clock management block is illustrated in figure below.

Figure 14 - Clock Management Overview

The block is configured in register RegClock (Cf §5 for more detailed information):

- Selection of internal clock source: none (OFF) or internal oscillator or external clock input from OSCIN.
- Definition of OSCIO pin function (OSCIN or OSCOUT)
- OSCOUT frequency setting (sub-multiple of fOSC)

Please note that if needed the OSCOUT feature can be used as an additional GPO (Cf. RegClock)

4.9 LED Driver

4.9.1 Overview

Every IO has its own independent LED driver to perform intensity control, blinking and fading operation. (Cf §6.2 for typical LED connection)

Please note that while all I/Os can perform intensity control (PWM) only some of them additionally include blinking and breathing features (Cf pin description §1)

The LED drivers of all I/Os share the same clock ClkX configurable in RegMisc[6:4]. Please note that for power consumption reasons ClkX is OFF by default.

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

ADVANCED COMMUNICATIONS & SENSING

Assuming ClkX is not OFF, LED driver for IO[X] is enabled when RegLEDDriverEnable[X] = 1 in which case it can operate in one of the three modes below:

- Static mode (all I/Os, with or without fade in/out)
- Single shot mode (blinking capable I/Os only, with or without fade in/out)
- Blink mode (blinking capable I/Os only, with or without fade in/out)

Figure 15 – LED Driver Overview

Each IO[X] has its own set of programmable registers (Cf §5 for more detailed information):

- > RegTOnX (blinking capable I/Os only): TOnX, ON time of IO[X]
- RegIOnX (all I/Os): IOnX, ON intensity of IO[X]
- RegOffX (blinking capable I/Os only): TOffX and IOffX, OFF time and intensity of IO[X]
- > RegTRiseX(breathing capable I/Os only): TRiseX, fade in time of IO[X]
- RegTFallX(breathing capable I/Os only): TFallX, fade out time of IO[X]

Please note that the LED driver mode is selectable for each IO bank between linear and logarithmic. (Cf §4.9.5)

All the figures assume normal IO polarity, for inverse polarity RegData control must be inverted (does not invert the polarity of the IO signal itself).

4.9.2 Static Mode

Only mode available for non blinking capable IOs (with Off intensity = 0), else invoked when TOnX = 0. If the I/O doesn't support fading the LED intensity will step directly to the IOnX/IOffX value.

Figure 16 - LED Driver Static Mode

ADVANCED COMMUNICATIONS & SENSING

4.9.3 Single Shot Mode

Invoked when TOnX != 0 and TOffX = 0.

If the I/O doesn't support fading the LED intensity will step directly to the IOnX/IOffX value.

Figure 17 - LED Driver Single Shot Mode

4.9.4 Blink Mode

Invoked when TOnX != 0 and TOffX != 0.

If the I/O doesn't support fading the LED intensity will step directly to the IOnX/IOffX value.

Figure 18 - LED Driver Blink Mode

4.9.5 LED Driver Modes

For each IO bank, the LED driver mode of fading capable IOs can be selected between linear or logarithmic in RegMisc.

Table 8 – LED Driver Linear vs Logarithmic Function (I)

Figure 19 – LED Driver Linear vs Logarithmic Function (II)

4.9.6 Synchronization of LED Drivers across several ICs

When several GPIO expanders are used in the same application it may be useful that their LEDs drivers are synchronous for coherent global operation.

In this case all ICs should share their fOSC through their OSCIO pins and have their NRESET pins connected together.

When RegMisc of each IC is set accordingly, NRESET signal can then be used to reset all devices' internal counters (but not the register settings) and allow synchronous LED operation (blinking, fading) across multiple devices.

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

ADVANCED COMMUNICATIONS & SENSING

4.9.7 Tutorial

Below are the steps required to use the LED driver with the typical LED connection described §6.2:

- Disable input buffer (RegInputDisable)
- Disable pull-up (RegPullUp)
- Enable open drain (RegOpenDrain)
- Set direction to output (RegDir) by default RegData is set high => LED OFF
- Enable oscillator (RegClock)
- Configure LED driver clock and mode if relevant (RegMisc)
- Enable LED driver operation (RegLEDDriverEnable)
- Configure LED driver parameters (RegTOn, RegIOn, RegOff, RegTRise, RegTFall)
- Set RegData bit low => LED driver started

0xXX	RegTFallX		4:0	Fade Out setting of IO[X] 0: OFF 1 - 15: TFallX = (RegIOnX-(4xRegOffX[2:0])) * RegTFallX * (255/ClkX) 16 - 31: TFallX = 16 * (RegIOnX-(4xRegOffX[2:0])) * RegTFallX * (255/ClkX)
0x2A	RegHighInput	0x00	7:0	Enables high input mode for each [input-configured] IO 0: OFF. VIH max = 3.6V and VCCx min = 1.2V 1: ON. VIH max = 5.5V and VCCx min = 1.65V
0x7D	RegReset	0x00	7:0	Software reset register Writing consecutively 0x12 and 0x34 will reset the device (same as POR). Always reads 0.

Table 12 – SX1508 Configuration Registers Description

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

ADVANCED COMMUNICATIONS & SENSING

5.3 SX1509 16-channel GPIO with LED Driver and Keypad Engine

Address	Name	Description	Default
Device and IC	D Banks		
0x00	RegInputDisableB	Input buffer disable register - I/O[15-8] (Bank B)	0000 0000
0x01	RegInputDisableA	Input buffer disable register - I/O[7-0] (Bank A)	0000 0000
0x02	RegLongSlewB	Output buffer long slew register - I/O[15-8] (Bank B)	0000 0000
0x03	RegLongSlewA	Output buffer long slew register - I/O[7-0] (Bank A)	0000 0000
0x04	RegLowDriveB	Output buffer low drive register - I/O[15-8] (Bank B)	0000 0000
0x05	RegLowDriveA	Output buffer low drive register - I/O[7-0] (Bank A)	0000 0000
0x06	RegPullUpB	Pull-up register - I/O[15-8] (Bank B)	0000 0000
0x07	RegPullUpA	Pull-up register - I/O[7-0] (Bank A)	0000 0000
0x08	RegPullDownB	Pull-down register - I/O[15-8] (Bank B)	0000 0000
0x09	RegPullDownA	Pull-down register - I/O[7-0] (Bank A)	0000 0000
0x0A	RegOpenDrainB	Open drain register - I/O[15-8] (Bank B)	0000 0000
0x0B	RegOpenDrainA	Open drain register - I/O[7-0] (Bank A)	0000 0000
0x0C	RegPolarityB	Polarity register - I/O[15-8] (Bank B)	0000 0000
0x0D	RegPolarityA	Polarity register - I/O[7-0] (Bank A)	0000 0000
0x0E	RegDirB	Direction register - I/O[15-8] (Bank B)	1111 1111
0x0F	RegDirA	Direction register - I/O[7-0] (Bank A)	1111 1111
0x10	RegDataB	Data register - I/O[15-8] (Bank B)	1111 1111 [*]
0x11	RegDataA	Data register - I/O[7-0] (Bank A)	1111 1111
0x12	RegInterruptMaskB	Interrupt mask register - I/O[15-8] (Bank B)	1111 1111
0x13	RegInterruptMaskA	Interrupt mask register - I/O[7-0] (Bank A)	1111 1111
0x14	RegSenseHighB	Sense register for I/O[15:12]	0000 0000
0x15	RegSenseLowB	Sense register for I/O[11:8]	0000 0000
0x16	RegSenseHighA	Sense register for I/O[7:4]	0000 0000
0x17	RegSenseLowA	Sense register for I/O[3:0]	0000 0000
0x18	RegInterruptSourceB	Interrupt source register - I/O[15-8] (Bank B)	0000 0000
0x19	RegInterruptSourceA	Interrupt source register - I/O[7-0] (Bank A)	0000 0000
0x1A	RegEventStatusB	Event status register - I/O[15-8] (Bank B)	0000 0000
0x1B	RegEventStatusA	Event status register - I/O[7-0] (Bank A)	0000 0000
0x1C	RegLevelShifter1	Level shifter register	0000 0000
0x1D	RegLevelShifter2	Level shifter register	0000 0000
0x1E	RegClock	Clock management register	0000 0000
0x1F	RegMisc	Miscellaneous device settings register	0000 0000
0x20	RegLEDDriverEnableB	LED driver enable register - I/O[15-8] (Bank B)	0000 0000
0x21	RegLEDDriverEnableA	LED driver enable register - I/O[7-0] (Bank A)	0000 0000
	d Keypad Engine		T
0x22	RegDebounceConfig	Debounce configuration register	0000 0000
0x23	RegDebounceEnableB	Debounce enable register - I/O[15-8] (Bank B)	0000 0000
0x24	RegDebounceEnableA	Debounce enable register - I/O[7-0] (Bank A)	0000 0000
0x25	RegKeyConfig1	Key scan configuration register	0000 0000
0x26	RegKeyConfig2	Key scan configuration register	0000 0000

Table 13 – SX1509 Configuration Registers Overview

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

Addr	Name	Default	Bits	Description			
0x00	RegInputDisableB	0x00	7:0	Disables the input buffer of each IO 0: Input buffer is enabled (input actually being used) 1: Input buffer is disabled (input actually not being used)	or LED connection)		
0x01	RegInputDisableA	0x00	7:0	Disables the input buffer of each IO 0 : Input buffer is enabled (input actually being used) 1 : Input buffer is disabled (input actually not being used, LED connection)			
0x02	RegLongSlewB	0x00	7:0	Enables increased slew rate of the output buffer of each [output-configured] IO 0 : Increased slew rate is disabled 1 : Increased slew rate is enabled			
0x03	RegLongSlewA	0x00	7:0	0 : Increased slew rate is disabled 1 : Increased slew rate is enabled			
0x04	RegLowDriveB	0x00	7:0	Enables reduced drive of the output buffer of each [outp 0 : Reduced drive is disabled 1 : Reduced drive is enabled			
0x05	RegLowDriveA	0x00	7:0	Enables reduced drive of the output buffer of each [outp 0 : Reduced drive is disabled 1 : Reduced drive is enabled	ut-configured] IO		
0x06	RegPullUpB	0x00	7:0	Enables the pull-up for each IO 0 : Pull-up is disabled 1 : Pull-up is enabled			
0x07	RegPullUpA	0x00	7:0	Enables the pull-up for each IO 0 : Pull-up is disabled 1 : Pull-up is enabled			
0x08	RegPullDownB	0x00	7:0	Enables the pull-down for each IO 0 : Pull-down is disabled 1 : Pull-down is enabled			
0x09	RegPullDownA	0x00	7:0	Enables the pull-down for each IO 0 : Pull-down is disabled 1 : Pull-down is enabled			
0x0A	RegOpenDrainB	0x00	7:0	Enables open drain operation for each [output-configured] IO 0 : Regular push-pull operation 1 : Open drain operation			
0x0B	RegOpenDrainA	0x00	7:0	Enables open drain operation for each [output-configured] IO 0 : Regular push-pull operation 1 : Open drain operation			
0x0C	RegPolarityB	0x00	7:0	Enables polarity inversion for each IO 0 : Normal polarity : RegData[x] = IO[x] 1 : Inverted polarity : RegData[x] = !IO[x] (for both input and output configured IOs)			
0x0D	RegPolarityA	0x00	7:0	Enables polarity inversion for each IO 0 : Normal polarity : RegData[x] = IO[x] 1 : Inverted polarity : RegData[x] = !IO[x] (for both input	and output configured IOs)		
0x0E	RegDirB	0xFF	7:0	Configures direction for each IO. 0 : IO is configured as an output 1 : IO is configured as an input			
0x0F	RegDirA	0xFF	7:0	Configures direction for each IO. 0 : IO is configured as an output 1 : IO is configured as an input			
0x10	RegDataB	0xFF	7:0	Write: Data to be output to the output-configured IOs Read: Data seen at the IOs, independent of the direction	n configured.		
0x11	RegDataA	0xFF	7:0	Write: Data to be output to the output-configured IOs Read: Data seen at the IOs, independent of the direction			
0x12	RegInterruptMaskB	0xFF	7:0	Configures which [input-configured] IO will trigger an into 0 : An event on this IO will trigger an interrupt 1 : An event on this IO will NOT trigger an interrupt	errupt on NINT pin		
0x13	RegInterruptMaskA	0xFF	7:0	Configures which [input-configured] IO will trigger an into 0 : An event on this IO will trigger an interrupt 1 : An event on this IO will NOT trigger an interrupt	errupt on NINT pin		
0x14	RegSenseHighB	0x00	7:6 5:4 3:2 1:0	Edge sensitivity of RegData[15] Edge sensitivity of RegData[14] Edge sensitivity of RegData[13] Edge sensitivity of RegData[12]	00 : None 01 : Rising 10 : Falling 11 : Both		
0x15	RegSenseLowB	0x00	7:6 5:4 3:2 1:0	Edge sensitivity of RegData[11] Edge sensitivity of RegData[10] Edge sensitivity of RegData[9] Edge sensitivity of RegData[8]	00 : None 01 : Rising 10 : Falling 11 : Both		
0x16	RegSenseHighA	0x00	7:6 5:4 3:2 1:0	Edge sensitivity of RegData[7] Edge sensitivity of RegData[6] Edge sensitivity of RegData[5] Edge sensitivity of RegData[4]	00 : None 01 : Rising 10 : Falling 11 : Both		
0x17	RegSenseLowA	0x00	7:6	Edge sensitivity of RegData[3]	00 : None		

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

			5:4	Edge sensitivity of RegData[2]	
			3:2	Edge sensitivity of RegData[1]	
			1:0	Edge sensitivity of RegData[0]	
0x18	RegInterruptSourceB	0x00	7:0	Interrupt source (from IOs set in RegInterruptMask) 0: No interrupt has been triggered by this IO 1: An interrupt has been triggered by this IO (an event as configured in relevant RegSense register occured). Writing '1' clears the bit in RegInterruptSource and in RegEventStatus When all bits are cleared, NINT signal goes back high.	
0x19	RegInterruptSourceA	0x00	7:0	Interrupt source (from IOs set in RegInterruptMask) 0 : No interrupt has been triggered by this IO 1 : An interrupt has been triggered by this IO (an event as configured in relevant RegSense register occured). Writing '1' clears the bit in RegInterruptSource and in RegEventStatus When all bits are cleared, NINT signal goes back high.	
0x1A	RegEventStatusB	0x00	7:0	Event status of all IOs. 0: No event has occured on this IO 1: An event has occured on this IO (an edge as configured in relevant RegSense register occured). Writing '1' clears the bit in RegEventStatus and in RegInterruptSource if relevant. If the edge sensitivity of the IO is changed, the bit(s) will be cleared automatically	
0x1B	RegEventStatusA	0x00	7:0	Event status of all IOs. 0 : No event has occured on this IO 1 : An event has occured on this IO (an edge as configured in relevant RegSense register occured). Writing '1' clears the bit in RegEventStatus and in RegInterruptSource if relevant. If the edge sensitivity of the IO is changed, the bit(s) will be cleared automatically	
			7:6	Level shifter mode for IO[7] (Bank A) and IO[15] (Bank B) 00 : OFF	
0x1C	RegLevelShifter1	0x00	5:4	Level shifter mode for IO[6] (Bank A) and IO[14] (Bank B) 01 : A->B	
	g		3:2	Level shifter mode for IO[5] (Bank A) and IO[13] (Bank B) Level shifter mode for IO[4] (Bank A) and IO[12] (Bank B) 10 : B->A 11 : Reserved	
			1:0	Ecver striker mode for re[4] (Bank 7) and re[12] (Bank B)	
			7:6 5:4	Level shifter mode for IO[3] (Bank A) and IO[11] (Bank B) 00 : OFF Level shifter mode for IO[2] (Bank A) and IO[10] (Bank B) 01 : A->B	
0x1D	RegLevelShifter2	0x00	3:2	Level shifter mode for IO[1] (Bank A) and IO[9] (Bank B) 10 : B->A	
			1:0	Level shifter mode for IO[0] (Bank A) and IO[8] (Bank B) 11 : Reserved	
0x1E	RegClock	0x00	6:5	Unused Oscillator frequency (fOSC) source 00 : OFF. LED driver, keypad engine and debounce features are disabled. 01 : External clock input (OSCIN) 10 : Internal 2MHz oscillator 11 : Reserved OSCIO pin function (Cf. §4.8) 0 : OSCIO is an input (OSCIN) 1 : OSCIO is an output (OSCOUT)	
			3:0	Frequency of the signal output on OSCOUT pin: 0x0 : 0Hz, permanent "0" logical level (GPO) 0xF : 0Hz, permanent "1" logical level (GPO) Else : fOSCOUT = fOSC/(2^(RegClock[3:0]-1))	
	RegMisc	0x00	7	LED Driver mode for Bank B 's fading capable IOs (IO15-12) 0: Linear 1: Logarithmic	
			6:4	Frequency of the LED Driver clock ClkX of all IOs: 0: OFF. LED driver functionality is disabled for all IOs. Else: ClkX = fOSC/(2^(RegMisc[6:4]-1))	
			3	LED Driver mode for Bank A 's fading capable IOs (IO7-4) 0: Linear 1: Logarithmic	
0x1F			2	NRESET pin function when externally forced low (Cf. §4.4.1 and §4.9.5) 0: Equivalent to POR 1: Reset PWM/Blink/Fade counters (not user programmed values) This bit is can only be reset manually or by POR, not by NRESET.	
			1	Auto-increment register address (Cf. §4.5) 0: ON. When several consecutive data are read/written, register address is incremented. 1: OFF. When several consecutive data are read/written, register address is kept fixed.	
			0	Autoclear NINT on RegData read (Cf. §4.7) 0: ON. RegInterruptSourceA/B is also automatically cleared when RegDataA/B is read. 1: OFF. RegInterruptSourceA/B must be manually cleared, either directly or via RegEventStatusA/B.	
0x20	RegLEDDriverEnableB	0x00	7:0	Enables LED Driver for each [output-configured] IO 0: LED Driver is disabled 1: LED Driver is enabled	

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

			1	LE 11 150 D. () 1 () () 7 () 7 ()	
0x21	RegLEDDriverEnableA	0x00	7:0	Enables LED Driver for each [output-configured] IO 0: LED Driver is disabled 1: LED Driver is enabled	
0x22 RegDebounceConfig		0x00	2:0	Unused Debounce time (Cf. §4.6.1) 000: 0.5ms x 2MHz/fOSC 001: 1ms x 2MHz/fOSC 010: 2ms x 2MHz/fOSC 011: 4ms x 2MHz/fOSC 100: 8ms x 2MHz/fOSC 101: 16ms x 2MHz/fOSC 111: 6ms x 2MHz/fOSC	
0x23	RegDebounceEnableB	0x00	7:0	Enables debouncing for each [input-configured] IO 0: Debouncing is disabled 1: Debouncing is enabled	
0x24	RegDebounceEnableA	0x00	7:0	Enables debouncing for each [input-configured] IO 0: Debouncing is disabled 1: Debouncing is enabled	
0x25 RegKeyConfig1		0x00	6:4	Reserved Auto Sleep time (no key press within this time will set keypad engine to sleep) 000 : OFF 001 : 128ms x 2MHz/fOSC 010 : 256ms x 2MHz/fOSC 011 : 512ms x 2MHz/fOSC 100 : 1sec x 2MHz/fOSC 101 : 2sec x 2MHz/fOSC 111 : 4sec x 2MHz/fOSC Unused	
			2:0	Scan time per row (must be set above debounce time). 000: 1ms x 2MHz/fOSC 001: 2ms x 2MHz/fOSC 010: 4ms x 2MHz/fOSC 011: 8ms x 2MHz/fOSC 100: 16ms x 2MHz/fOSC 101: 32ms x 2MHz/fOSC 110: 64ms x 2MHz/fOSC 111: 128ms x 2MHz/fOSC	
0x26	Number of columns (inputs) 000 : 1 column – IO[8] 001 : 2 columns – IO[8:9] 010 : 3 columns – IO[8:10] 2:0 011 : 4 columns – IO[8:11] 100 : 5 columns – IO[8:12] 101 : 6 columns – IO[8:13]		Number of rows (outputs) + key scan enable 000 : Key scan OFF 001 : 2 rows – IO[0:1] 010 : 3 rows – IO[0:2] 011 : 4 rows – IO[0:3] 100 : 5 rows – IO[0:4] 101 : 6 rows – IO[0:5] 110 : 7 rows – IO[0:6] 111 : 8 rows – IO[0:7] Number of columns (inputs) 000 : 1 column – IO[8] 001 : 2 columns – IO[8:9] 010 : 3 columns – IO[8:10] 011 : 4 columns – IO[8:11] 100 : 5 columns – IO[8:12]		
0x27	RegKeyData1	0xFF	7:0	111 : 8 columns – IO[8:15] Column which generated NINT (active low) Ex: RegKeyData1=11011111 => IO13 has generated NINT The register is automatically cleared when RegKeyData2 is read.	
0x28	RegKeyData2	0xFF	7:0	Row which generated NINT (active low) Ex: RegKeyData2=11111110 => IO0 has generated NINT When the register is read both RegKeyData1 & RegKeyData2 are automatically cleared together with NINT and key scan continues.	
0xXX	RegTOnX	0x00	7:5 4:0	Unused ON Time of IO[X]: 0 : Infinite (Static mode, TOn directly controlled by RegData, Cf §4.9.2) 1 - 15 : TOnX = 64 * RegTOnX * (255/ClkX) 16 - 31 : TOnX = 512 * RegTOnX * (255/ClkX)	
0xXX	ReglOnX	0xFF	7:0	ON Intensity of IO[X] - Linear mode : IOnX = RegIOnX - Logarithmic mode (fading capable IOs only) : IOnX = f(RegIOnX) , Cf §4.9.5

ADVANCED COMMUNICATIONS & SENSING

6 APPLICATION INFORMATION

6.1 Typical Application Circuit

Figure 20 - Typical Application Schematic

6.2 Typical LED Connection

Typical LED Connection is described below. The LED is usually connected to a high voltage (VBAT) to take advantage of the high sink current of the I/O and to accommodate high LED threshold voltages (VLED).

Please note that in this configuration the IO must be programmed as open drain output (RegOpenDrain) with no pull-up (RegPullUp) and input buffer must be disabled (RegInputBufferDisable).

VCCx can take any value without compromising LED operation.

*LED colour/technology dependent

Figure 21 – Typical LED Operation

Serial R must be calculated for IOL not to exceed its max spec (Cf. Table 5) else VOL will increase.

QFN-UT 20-pin, 3 x 3 mm, 0.4 mm pitch

| DIMENSIONS | | DIMENSIONS

NOTES:

- 1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
- 2. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.
- 3. DAP IS 1.90 x 1.90mm.

SOLDERING PROFILE

The soldering reflow profile for the SX1507, SX1508 and SX1509 is described in the standard IPC/JEDEC J-STD-020C. For detailed information please go to http://www.jedec.org/download/search/jstd020c.pdf

Profile Feature	Sn-Pb Eutectic Assembly	Pb-Free Assembly
Average Ramp-Up Rate (Ts _{max} to Tp)	3 °C/second max.	3° C/second max.
Preheat - Temperature Min (Ts _{min}) - Temperature Max (Ts _{max}) - Time (ts _{min} to ts _{max})	100 °C 150 °C 60-120 seconds	150 °C 200 °C 60-180 seconds
Time maintained above: - Temperature (T_L) - Time (t_L)	183 °C 60-150 seconds	217 °C 60-150 seconds
Peak/Classification Temperature (Tp)	See Table 4.1	See Table 4.2
Time within 5 °C of actual Peak Temperature (tp)	10-30 seconds	20-40 seconds
Ramp-Down Rate	6 °C/second max.	6 °C/second max.
Time 25 °C to Peak Temperature	6 minutes max.	8 minutes max.

Note 1: All temperatures refer to topside of the package, measured on the package body surface.
