## Universal Synchronous EPLD

### Features

- 100-MHz output registered operation
- Twelve I/O macrocells, each having:
  - Registered, three-state I/O pins
  - Input and output register clock select multiplexer
  - Feed back multiplexer
  - Output enable ( $\overline{OE}$ ) multiplexer
- Bypass on input and output registers
- All twelve macrocell state registers can be hidden
- User configurable I/O macrocells to implement JK or RS flip-flops and T or D registers
- Input multiplexer per pair of I/O macrocells allows I/O pin associated with a hidden macrocell state register to be saved for use as an input
- Four dedicated hidden registers
- Twelve dedicated registered inputs with individually programmable bypass option
- Three separate clocks—two input clocks, two output clocks
- Common (pin 14-controlled) or product term-controlled output enable for each I/O pin
- 256 product terms—32 per pair of macrocells, variable distribution
- Global, synchronous, product term-controlled, state register set and reset—inputs to product term are clocked by input clock

- 2-ns input set-up and 9-ns output register clock to output
- 10-ns input register clock to state register clock
- 28-pin, 300-mil DIP, LCC, PLCC
- Erasable and reprogrammable
- Programmable security bit

### Functional Description

The CY7C335 is a high-performance, erasable, programmable logic device (EPLD) whose architecture has been optimized to enable the user to easily and efficiently construct very high performance state machines.

The architecture of the CY7C335, consisting of the user-configurable output macrocell, bidirectional I/O capability, input registers, and three separate clocks, enables the user to design high-performance state machines that can communicate either with each other or with microprocessors over bidirectional parallel buses of user-definable widths.

The four clocks permit independent, synchronous state machines to be synchronized to each other.

The user-configurable macrocells enable the designer to designate JK-, RS-, T-, or D-type devices so that the number of product terms required to implement the logic is minimized.

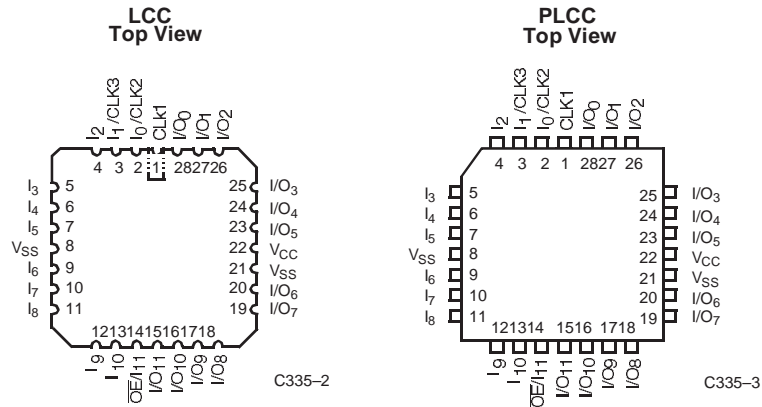

The CY7C335 is available in a wide variety of packages including 28-pin, 300-mil plastic and ceramic DIPs, PLCCs, and LCCs.

### Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature ..... -65°C to +150°C

Ambient Temperature with Power Applied..... -55°C to +125°C

Supply Voltage to Ground Potential (Pin 22 to Pins 8 and 21) ..... -0.5V to +7.0V

DC Voltage Applied to Outputs in High Z State ..... -0.5V to +7.0V

DC Input Voltage..... -3.0V to +7.0V

Output Current into Outputs (Low)..... 12 mA

Static Discharge Voltage ..... >2001V (per MIL-STD-883, Method 3015)

Latch-Up Current..... >200 mA

DC Programming Voltage..... 13.0V

Parameter	Description	Test Conditions	Min.	Max.	Unit
C <sub>IN</sub>	Input Capacitance	V <sub>IN</sub> = 2.0V @ f = 1 MHz		10	pF
C <sub>OUT</sub>	Output Capacitance	V <sub>OUT</sub> = 2.0V @ f = 1 MHz		10	pF

#### Notes:

1. t<sub>A</sub> is the "instant on" case temperature.
2. See the last page of this specification for Group A subgroup testing information.
3. These are absolute values with respect to device ground and all overshoots due to system or tester noise are included.
4. Not more than one output should be tested at a time. Duration of the short circuit should not be more than one second. V<sub>OUT</sub> = 0.5V has been chosen to avoid test problems caused by ground degradation.
5. Tested initially and after any design or process changes that may affect these parameters.

**Notes:**

- This specification is intended to guarantee interface compatibility of the other members of the CY7C330 family with the CY7C335. This specification is met for the devices operating at the same ambient temperature and at the same power supply voltage.
- This part has been designed with the capability to reset during system power-up. Following power-up, the input and output registers will be reset to a logic LOW state. The output state will depend on how the array is programmed.
