

### POWER MANAGEMENT

#### Description

The SC431L is a three terminal adjustable shunt regulator with thermal stability guaranteed over temperature. The output voltage can be adjusted to any value from 1.24V ( $V_{REF}$ ) to 20V with two external resistors. The SC431L has a typical dynamic output impedance of 0.05Ω. Active output circuitry provides a very sharp turn on characteristic, making the SC431L an excellent replacement for zener diodes.

The SC431L shunt regulator is available with four voltage tolerances (0.25%, 0.5%, 1.0% and 2.0%), two operating temperature ranges (commercial and industrial) and two package options (SOT-23-3 and SOT-23-5). This allows the designer the opportunity to select the optimum combination of cost and performance for their application.

#### Features

- ◆ Low voltage operation (down to 1.24V)
- ◆ Wide operating current range 100µA to 100mA
- ◆ Low dynamic output impedance 0.05 Ω typ.
- ◆ Trimmed bandgap design ± 0.25%
- ◆ Upgrade for TLV431A
- ◆ SOT-23-3 and SOT-23-5 packages. Also available in Lead-free package, fully WEEE and RoHS compliant

#### Applications

- ◆ Linear Regulators
- ◆ Adjustable Supplies
- ◆ Switching Power Supplies
- ◆ Battery Operated Computers
- ◆ Instrumentation
- ◆ Computer Disk Drives

#### Typical Application Circuit<sup>(1)(2)</sup>

#### Notes:

- 1) Set  $V_{OUT}$  according to the following equation:

$$V_{OUT} = V_{REF} \left( 1 + \frac{R1}{R2} \right) + I_{REF} R1$$

- 2) Choose the value for R as follows:

- The maximum limit for R should be such that the cathode current,  $I_z$ , is greater than the minimum operating current (100µA) at  $V_{IN(MIN)}$ .

- The minimum limit for R should be such that  $I_z$  does not exceed 100mA under all load conditions, and the instantaneous turn-on value for  $I_z$  does not exceed 150mA. Both of the following conditions must be met:

$$R_{min} \geq \frac{V_{IN(max)}}{150 \text{ mA}} \quad (\text{to limit instantaneous turn-on } I_z)$$

$$R_{min} \geq \frac{V_{IN(max)} - V_{OUT}}{I_{OUT(min)} + 100 \text{ mA}} \quad (\text{to limit } I_z \text{ under normal operating conditions})$$

## POWER MANAGEMENT

### Applications Information - Stability

#### **Selection of load capacitance when using SC431L as a shunt regulator**

When the SC431L is used as a shunt regulator, two options for selection of  $C_L$  (see diagram on page 7) are recommended for optimal stability:

- 1) No load capacitance across the device, decouple at the load.
- 2) Large capacitance across the device, optional decoupling at the load.

The reason for this is that SC431L exhibits instability with capacitances in the range of 10nF to 1 $\mu$ F (approx.) at light cathode currents (up to 3mA typical). The device is less stable the lower the cathode voltage has been set for. Therefore while the device will be perfectly stable operating at a cathode current of (say) 10mA with a 0.1 $\mu$ F capacitor across it, it will oscillate transiently during start-up as the cathode current passes through the instability region. Selecting a very low (or preferably, no) capacitance, or alternatively a high capacitance (such as 10 $\mu$ F) will avoid this issue altogether. Since the user will probably wish to have local decoupling at the load anyway, the most cost effective method is to use no capacitance at all directly across the device. PCB trace/via resistance and inductance prevent the local load decoupling from causing the oscillation during the transient start-up phase. Note: if the SC431L is located right at the load, so the load decoupling capacitor is directly across it, then this capacitor will have to be  $\leq 1$ nF or  $\geq 10\mu$ F.
