
**PWM STEP-UP DC/DC CONVERTER
WITH VOLTAGE REGULATOR AND DETECTOR**

RS5RM SERIES

APPLICATION MANUAL

NO.EA-018-0006

RS5RM SERIES

OUTLINE

The RS5RM Series are step-up DC/DC converter ICs equipped with a voltage regulator (VR) and a voltage detector (VD) by CMOS process. Each of these step-up DC/DC converter ICs consists of a PWM DC/DC converter, a linear regulator and a voltage detector. These ICs are output-voltage-fixed type regulators which function as a linear regulator when input voltage is high, and as step-up DC/DC converter+linear regulator when input voltage is low, by using an inductor, a diode and a capacitor as external parts for the ICs.

Since a voltage detector is built in these ICs, the potentials such as the output voltage of DC/DC converters can be monitored.

In addition, these step-up DC/DC converter ICs are suitable for battery-powered and hand-held instruments because internal circuits can be turned off by the chip enable function so that the standby current can be minimized.

FEATURES

- Low Supply CurrentTYP. 55 μ A (RS5RM3624A : V_{IN} =3.0V, at no load)
- Standby Mode.....Istandby=MAX. 1.0 μ A (RS5RM $\times\times\times\times$ A)
Istandby=MAX. 10.0 μ A (RS5RM $\times\times\times\times$ B)
- Low Voltage Operation Possible.....Operating Voltage V_{IN} =1.2V to 10V
- High Output Voltage Accuracy.....Fixed Output Voltage Accuracy \pm 2.5%
- High Voltage Detection Accuracy \pm 2.5%
- Output Voltage can be set at User's request (refer to Selection Guide).
- Voltage close to battery's voltage can be output because these ICs are of a step-up / step-down type (Ex. a fixed voltage of 3V can be output by a 3V battery).
- Soft Start Function, built-in Protection Circuits for Lx Driver
- Phase Compensation Circuits built in
- Pin for External Driver is equipped, and a large current output can be obtained.
- Small Packages8pin SOP

APPLICATIONS

- Power source for cameras, camcorders, and hand-held audio equipment.
- Power source for small OA apparatus such as note book personal computers, and word processors.
- Power source for hand-held communication appliances such as pagers, cordless telephones, and cellular phones.

BLOCK DIAGRAM

SELECTION GUIDE

In the RS5RM Series, the output voltage, the detector threshold, the version symbols, and the taping type for the ICs can be selected at the user's request.

The selection can be made by designating the part number as shown below:

RS5RM $\overset{\uparrow}{\times} \overset{\uparrow}{\times} \overset{\uparrow}{\times} \overset{\uparrow}{\times} - \overset{\uparrow}{\times} \overset{\uparrow}{\times}$ ← Part Number
 a b c d

Code	Contents
a	Setting Output Voltage (VOUT): Stepwise setting with a step of 0.1V in the range of 1.5V to 6.0V is possible.
b	Setting Detector Threshold (-VDET): Stepwise setting with a step of 0.1V in the range of 1.2V to 5.0V is possible.
c	Designation of Version Symbols: A: Operation of all the internal circuits is stopped by setting \overline{CE} pin at VDD level. B: Operation of only Step-up DC/DC converter is stopped by setting \overline{CE} pin at VDD level.
d	Designation of Taping Type: Ex. 8pin SOP : T1, T2 (refer to Taping Specification) "T2" is prescribed as a standard.

For example, the product with Output Voltage 5.0V, Detector Threshold 4.5V, Version A, and Taping Type T1, is designated by Part Number RS5RM5045A-T1.

PIN CONFIGURATION

• 8pin SOP

PIN DESCRIPTION

Pin No.	Symbol	Pin Description
1	VSS	Ground Pin
2	$\overline{\text{CE}}$	Chip Enable Pin
3	VDOUT	Voltage Detector Output Pin.Nch Open Drain Output
4	VDIN	Detection Input Pin of Voltage Detector
5	VOUT	Output Pin for Regulator
6	VDD	Step-up Output Pin.Power Supply Pin
7	EXT	External Transistor Drive Pin
8	LX	External Inductor Drive Pin.

ABSOLUTE MAXIMUM RATINGS

 $T_{opt}=25^{\circ}\text{C}, V_{ss}=0\text{V}$

Symbol	Item		Rating	Unit	
V _{DD}	Supply Voltage		-0.3 to +12	V	
V _{LX}	Output Voltage	LX Pin Voltage	V _{SS} -0.3 to +12	V	
V _{EXT}		EXT Pin Voltage	V _{SS} -0.3 to V _{DD} +0.3	V	
V _{OUT}		V _{OUT} Pin Voltage	V _{SS} -0.3 to V _{DD} +0.3	V	
V _{DOUT}		V _{DOUT} Pin Voltage	V _{SS} -0.3 to +12	V	
V _{CE}	Input Voltage	$\overline{\text{CE}}$ Pin Voltage	V _{SS} -0.3 to V _{DD} +0.3	V	
V _{DIN}		V _{DIN} Pin Voltage	A Version	V _{SS} -0.3 to V _{DD} +0.3	V
			B Version	V _{SS} -0.3 to +12	
I _{LX}	Inductor Drive Output Current	Lx Pin Current	250	mA	
I _{EXT}		EXT Pin Current	50	mA	
P _D	Power Dissipation		300	mW	
T _{opt}	Operating Temperature Range		-30 to +80	°C	
T _{stg}	Storage Temperature Range		-55 to +125	°C	
T _{solder}	Lead Temperature (Soldering)		260°C, 10s		

ABSOLUTE MAXIMUM RATINGS

Absolute Maximum ratings are threshold limit values that must not be exceeded even for an instant under any conditions. Moreover, such values for any two items must not be reached simultaneously. Operation above these absolute maximum ratings may cause degradation or permanent damage to the device. These are stress ratings only and do not necessarily imply functional operation below these limits.

OPERATION OF STEP-UP DC/DC CONVERTER

Step-up DC/DC Converter charges energy in the inductor when Lx Tristor (LxTr) is ON, and discharges the energy with the addition of the energy from Input Power Source thereto when LxTr is OFF, so that a higher output voltage than the input voltage is obtained.

The operation will be explained with reference to the following diagrams :

Step.1: LxTr is turned ON and current $I_L (=i1)$ flows, so that energy is charged in L. At this moment, $I_L (=i1)$ is increased from $I_{Lmin} (=0)$ to reach I_{Lmax} in proportion to the on-time period (t_{on}) of LxTr.

Step.2: When LxTr is turned OFF, Schottky diode (SD) is turned ON in order that L maintains I_L at I_{Lmax} , so that current $I_L (=i2)$ is released.

Step.3: $I_L (=i2)$ is gradually decreased, and in the case of discontinuous mode, I_L reaches $I_{Lmin} (=0)$ after a time period of t_{open} , so that SD is turned OFF. In the case of a continuous mode, the time period (t_{off}) runs out before I_L reaches $I_{Lmin} (=0)$, so that LxTr is turned ON in the next cycle, and SD is turned OFF. In this case, I_{Lmin} does not reach zero, and $I_L (=i1)$ increases from $I_{Lmin} (>0)$.

In the case of PWM control system, with the oscillator frequency (f_{osc}) maintained constant, the output voltage is maintained constant by controlling the on-time period (t_{on}).

■ (Note) Please refer to the Application Manual for "RH5RH SERIES" for details.

OPERATION

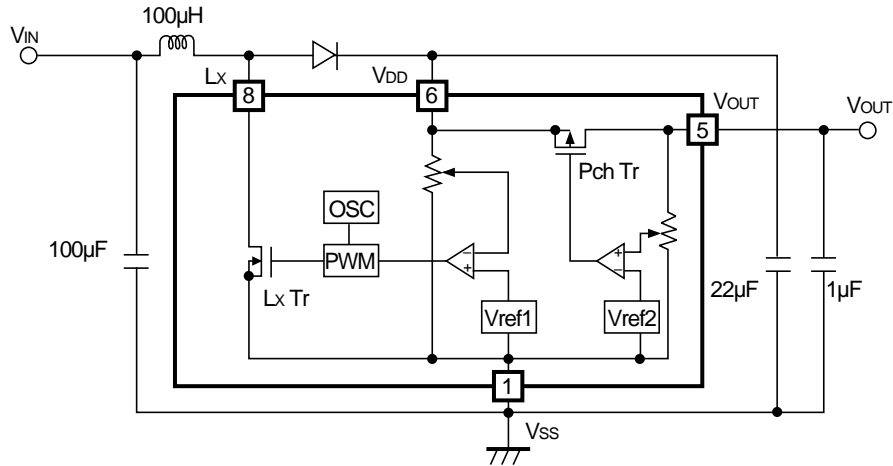

FIG. A Diagram of RS5RM including external circuits

1. VDD Output Voltage

VDD output voltage is shown in Fig. B.

(1) In the case of $V_{IN} - V_f \geq V_{DD0}$:

In Area B, LxTr is maintained in an OFF state, so that $V_{IN} - V_f$ (V) is output as it is from VDD pin without step-up operation.

(2) In the case of $V_{IN} - V_f < V_{DD0}$:

In Area A, this IC functions as Step-up DC/DC converter. The step-up operation will now be explained with reference to FIG. A. The step-up operation is an operation for regulating the VDD output voltage by comparing Vref1 and the VDD output voltage by error amplifier circuits and subjecting LxTr to on-time control by PWM circuits (i.e., by controlling the step-up operation).

2. VOUT Output Voltage

A constant voltage is output from VOUT pin, with above-mentioned the VDD output voltage being subjected to a step-down operation by a linear regulator. This step-down operation will now be explained with reference to FIG. A. The step-down operation is an operation for regulating the VDD output voltage by Pch Tr by comparing Vref2 and the VDD output voltage.

- VIN : Input Voltage
- VDD0 : VDD Set Voltage
- VOUT0 : VOUT Set Voltage
- Vf : ON Voltage of Diode

(NOTE) Efficiency η at Typical Characteristics 20) is shown by the following formula: $\eta = \frac{(V_{DD} \times I_{DDOUT}) + (V_{OUT} \times I_{OUT})}{V_{IN} \times I_{IN}} \times 100$

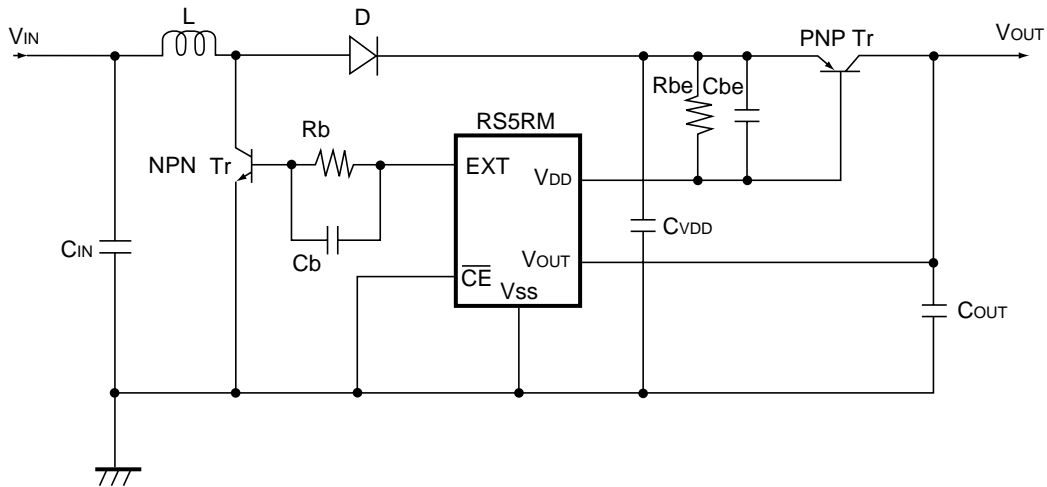

BASIC CIRCUIT

Examples of Parts : Inductor : RCR-664D (100 μ H) ; Sumida Electric Co., Ltd.
 Diode : MA721 (Schottky type) ; Matsushita Electronics Corporation
 Capacitor : 22 μ F (Tantalum type)

TYPICAL APPLICATIONS

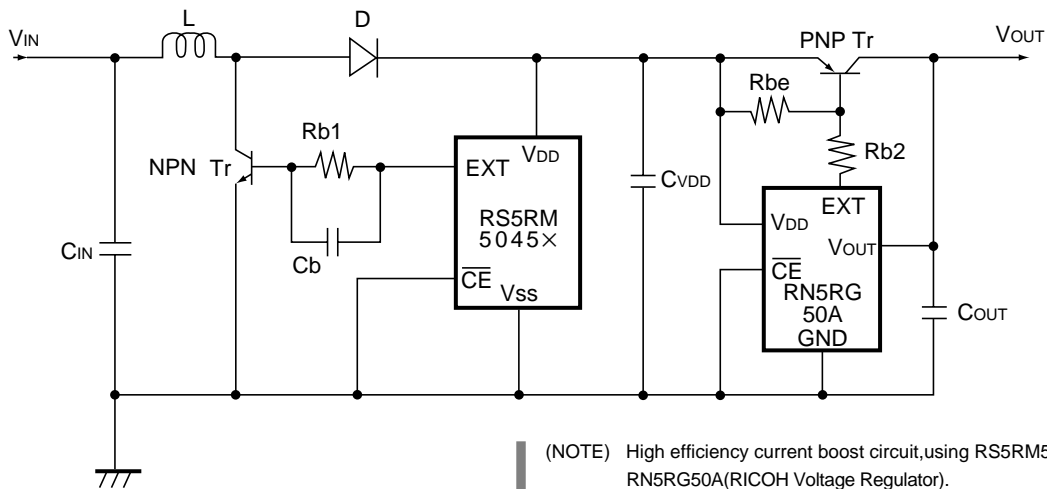

• Current Boost Circuit 1

Examples of Components

L	:47 μ F(SUMIDA ELECTRIC CD105)	Cd	:0.01 μ F
D	:Schottky Diode (HITACHI HRP22)	Cbe	:0.1 μ F(RS5RM5045 \times ,RS5RM4036 \times ,RS5RM3624 \times)
CIN	:220 μ F(Aluminum electrolytic Type)		100pF(RS5RM3531 \times ,RS5RM3329 \times ,RS5RM3027 \times)
CVDD	:100 μ F(Tantalum type)/ 220 μ F(Aluminum electrolytic Type)	NPN Tr	:2SD1628
COUT	:47 μ F(Tantalum Type)	PNP Tr	:2SA1213
		Rb	:220 Ω
		Rbe	:12 Ω

• Current Boost Circuit 2 (High Efficiency Circuit)

(NOTE) High efficiency current boost circuit,using RS5RM5045 \times with RN5RG50A(RICOH Voltage Regulator).

Examples of Components

L	:47 μ F(SUMIDA ELECTRIC CD105)	Cd	:0.01 μ F
D	:Schottky Diode (HITACHI HRP22)	NPN Tr	:2SD1628
CIN	:220 μ F(Aluminum electrolytic Type)	PNP Tr	:2SA1213
CVDD	:33 μ F(Tantalum type)/ 220 μ F(Aluminum electrolytic Type)	Rb1	:220 Ω
COUT	:47 μ F(Tantalum Type)	Rb2	:330 Ω
		Rbe	:10k Ω

APPLICATION HINTS

When using these ICs, be sure to take care of the following points:

- Set external components as close as possible to the IC and minimize the connection between the components and the IC. In particular, when an external component is connected to V_{OUT} Pin, make minimum connection with the capacitor.
- Make sufficient grounding. A large current flows through V_{SS} Pin by switching. When the impedance of the V_{SS} connection is high, the potential within the IC is varied by the switching current. This may result in unstable operation of the IC.
- Use capacitor with a capacity of 10 μ F or more, and with good high frequency characteristics such as tantalum capacitor. We recommend the use of a capacitor with an allowable voltage which is at least three times the output set voltage. This is because there may be the case where a spike-shaped high voltage is generated by the inductor when L_x transistor is turned OFF.
- Take the utmost care when choosing an inductor. Namely, choose such an inductor that has sufficiently small d.c. resistance and large allowable current, and hardly reaches magnetic saturation. When the inductance value of the inductor is small, there may be the case where I_{LX} exceeds the absolute maximum ratings at the maximum load. Use an inductor with an appropriate inductance.
- Use a diode of a Schottky type with high switching speed, and also take care of the rated current.

The performance of power source circuits using these ICs largely depends upon the peripheral components. Take the utmost care in the selection of the peripheral components. In particular, design the peripheral circuits in such a manner that the values such as voltage, current and power of each component, PCB patterns and the IC do not exceed their respective rated values.
