Car radio tuner front-end for digital IF

TEF6721HL

1 FEATURES

- FM mixer for conversion of FM RF (64 to 108 MHz and US weather band) to IF of 10.7 MHz; the mixer provides inherent image rejection and can be switched from 'low' injection to 'high' injection Local Oscillator (LO) via the I²C-bus; two different mixer conversion gains can be selected via the I²C-bus
- AGC PIN diode drive circuit for FM RF AGC; AGC detection at FM mixer input and IF AGC amplifier input; AGC threshold for detection at FM mixer input is a programmable and keyed function switchable via the I²C-bus; the AGC PIN diode drive can be activated via the I²C-bus as a local function for search tuning; in AM mode the AGC PIN diode drive can be activated via the I²C-bus if required
- Digital alignment circuit for bus controlled matching of oscillator tuning voltage to FM antenna tank circuit tuning voltage
- Buffer output for weather band flag
- Combined AM and FM IF AGC amplifier with high dynamic input range; one of the four gain settings is selected automatically via two control signals from IF DSP; combined differential AM and FM IF output signal to analog-to-digital converter of IF DSP
- AM mixer for conversion of AM RF to AM IF 10.7 MHz
- AM RF PIN diode drive circuit and RF JFET conductance control by AGC cascode drive circuit; AGC threshold detection at AM mixer and IF AGC input; threshold for detection at AM mixer is programmable via the I²C-bus
- AM and FM RF AGC monitor output intended for gain control of active antennas
- LC tuner oscillator providing mixer frequencies for FM and AM mixers

- Crystal oscillator providing reference frequencies for synthesizer PLL and timing for Alternate Frequency (AF) updating
- Optional crystal oscillator frequency pulling possibility via I²C-bus
- Fast synthesizer PLL tuning system with local control for inaudible AF updating
- Timing function for AF updating algorithm and control signal output for interfacing with IF DSP
- Three hardware programmable I²C-bus addresses; pin BUSENABLE; two software controlled flag outputs
- Several test modes for fast IC tests.

2 GENERAL DESCRIPTION

The TEF6721HL is a single chip car radio tuner for AM, FM standard, FM IBOC DAB and weather band providing combined AM and FM gain controlled differential IF output for the SAF7730H including the following functions:

- AM upconversion tuner to an IF frequency of 10.7 MHz for LW/MW/SW (31 m, 41 m and 49 m bands)
- FM single conversion tuner to an IF frequency of 10.7 MHz with integrated image rejection for US FM, Europe FM, Japan FM, East Europe FM and weather band reception; all bands can be selected using high side or low side Local Oscillator (LO) injection
- Tuning system includes VCO, crystal oscillator and PLL synthesizer on one chip.

7 FUNCTIONAL DESCRIPTION

7.1 FM I/Q-mixer

The FM quadrature mixer converts FM RF (64 to 108 MHz and 162.4 to 162.55 MHz) to an IF of 10.7 MHz.

It provides inherent image rejection and high dynamic range. The image rejection can be switched from 'low' injection Local Oscillator (LO) to 'high' injection LO via the I²C-bus. The mixer conversion gain can be increased by 6 dB via the I²C-bus. In this case the threshold of the FM keyed AGC has to be lowered by 6 dB to prevent the mixer from being overloaded.

7.2 Buffer output for weather band flag

The buffer output (pin WBFLAG) is HIGH for weather band mode.

7.3 VCO

The varactor tuned LC oscillator provides the local oscillator signal for both FM and AM mixers. It has a frequency range from 159.9 to 248.2 MHz.

7.4 Crystal oscillator

The crystal oscillator provides a 20.5 MHz signal that is used for:

- Reference frequency for frequency synthesizer PLL
- Timing signal for the RDS update algorithm.

7.5 PLL

The fast synthesizer PLL tuning system with local control is used for inaudible AF updating, combining fast PLL jumps with low reference frequency breakthrough.

It is capable of tuning the following FM and AM bands:

- US FM and US IBOC DAB from 87.9 to 107.9 MHz
- US weather FM from 162.4 to 162.55 MHz
- Europe FM from 87.5 to 108 MHz
- Japan FM from 76 to 91 MHz
- East Europe FM from 64 to 74 MHz
- LW from 144 to 288 kHz
- MW from 522 to 1710 kHz (US AM band)
- SW from 5.73 to 9.99 MHz (including the 31 m, 41 m and 49 m bands).

7.6 DAA

To reduce the number of manual alignments in production the following I²C-bus controlled Digital Auto Alignment (DAA) functions are included:

- FM RF DAA
 - 7-bit DAC to control the conversion of the VCO tuning voltage to FM antenna tank tuning voltage
 - For cost reduction the diode at pin DAATD can be omitted from this application. In this case, pin DAATD must be connected to ground, which reduces the available alignment range (see Fig.7)
- Crystal frequency and general purpose DAA
 - 5-bit DAC for adjustment of the crystal oscillator frequency to align the actual IF frequency to the centre frequency of IF selectivity inside the IF DSP. If the IF DSP can be aligned to the actual IF frequency, this DAA output can be used as general purpose DAC. Figure 3 shows the application of the crystal oscillator with frequency pulling.

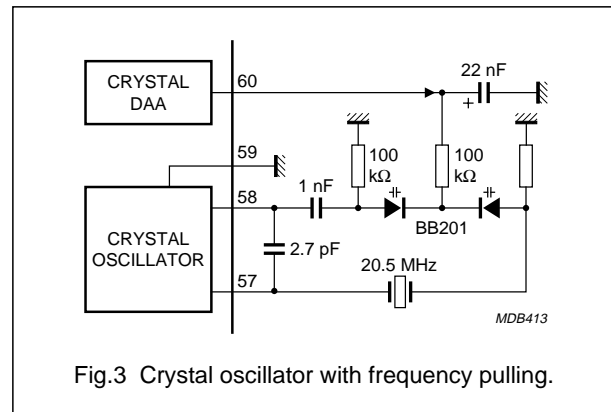

Fig.3 Crystal oscillator with frequency pulling.

Car radio tuner front-end for digital IF

TEF6721HL

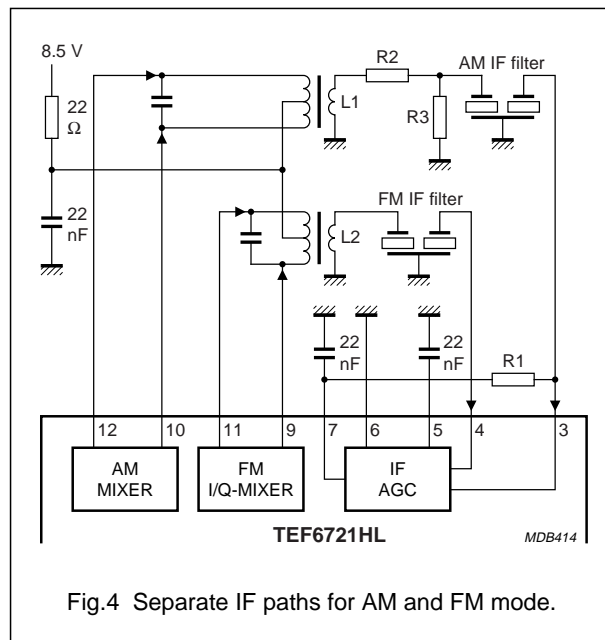

7.7 FM keyed AGC

The AGC detects at the FM mixer input and the IF AGC amplifier input. The AGC threshold for the FM mixer input is programmable via the I²C-bus. When the threshold is exceeded, the AGC sources a current to an external PIN diode circuit, keeping the RF signal level at the FM mixer input constant.

The keyed function shifts the threshold of the AGC if the in-band signal is small. This reduces desensitization by other strong transmitters. The amount of threshold shift is limited to 10 dB. The keyed function can be activated via the I²C-bus and is controlled by in-band level information delivered from IF DSP via pin KAGC.

The AGC can be activated via the I²C-bus to source a fixed current as a local function for search tuning. In AM mode the AGC can be activated to source a constant 10 mA current into the FM PIN diode.

7.8 AM mixer

The AM mixer has a high dynamic range and converts AM RF to an IF frequency of 10.7 MHz.

The outputs of the AM and FM mixers can be separated to allow the use of different IF filters for AM and FM modes. Figure 4 shows this optional application. By adding the resistor R1 between pins AMIFIN and IFAGCBIAS the input impedance of the IF AGC amplifier is matched to the AM IF filter output impedance.

The input impedance of the AM IF filter is matched to 330 Ω with R2 and R3.

7.9 AM RF AGC

The AM wideband AGC in front of the AM mixer is realized first by a cascoded NPN transistor, which controls the transconductance of the RF amplifier JFET with 10 dB of AGC range. Second, an AM PIN diode stage with 30 dB of AGC range is available. The minimum JFET drain source voltage is controlled by a DC feedback loop (pin VAMCASFB) in order to limit the cascode AGC range to 10 dB. If the cascode AGC is not required, a simple RF AGC loop is possible by using only a PIN diode. In some conditions, noise behaviour will increase. In this case pins VAMCAS and VAMCASFB have to be left open-circuit. In FM mode, the cascode switches off the JFET bias current to reduce total power consumption.

The AGC detection points for AM RF AGC are at the AM mixer input (threshold programmable via the I²C-bus) and the AM and FM IF AGC amplifier input (fixed threshold).

In FM mode the AM AGC can be activated via the I²C-bus to sink a constant current of 1 mA from the PIN diode.

7.10 FM/AM RF AGC buffer

This output current can be used to reduce the gain of active antennas before start of RF AGC.

The output (open-collector) sinks a current which in AM mode is proportional to the voltage at pin TRFAMAGC and in FM mode proportional to the RF level detector voltage (pin TFMAGC) inside the FM AGC.

V _{es}	electrostatic handling voltage	note 2	-200	+200	V
		note 3	-2000	+2000	V

Notes

1. To avoid damages and wrong operation it is necessary to keep all 8.5 V supply voltages at a higher level than any 5 V supply voltage. This is also necessary during power-on and power-down sequences. Precautions have to be provided in such a way that interferences can not pull down the 8.5 V supply below the 5 V supply.
2. Machine model (R = 0 Ω, C = 200 pF).
3. Human body model (R = 1.5 kΩ, C = 100 pF).

$V_{o(n)}$	DAA output noise voltage	B = 300 Hz to 22 kHz	–	100	130	μV

Notes

- Measured between pins XTAL1 and XTAL2.
- DAA conversion gain formula: $V_{DAAOUT} = \left[2 \times \left(0.75 \times \frac{n}{128} + 0.125 \right) \times (V_{DAAIN} + V_{DAATD}) \right] - V_{DAATD}$; where
n = 0 to 127.
- $V_{LSB} = V_{DAAOUT(n+1)} - V_{DAAOUT(n)}$
- The AM AGC transconductance buffer delivers a sink current which is proportional to the voltage change at pin TRFAMAGC. $\Delta V_{TRFAMAGC} = V_{TRFAMAGC} - V_{TRFAMAGC}|_{(V_{AMMIXIN} - V_{AMMIXDEC}) < 10 \text{ mV}}$
- Image rejection ratio: $IRR = \frac{V_{(FMMIXOUT1 - FMMIXOUT2)\text{wanted}}}{V_{(FMMIXOUT1 - FMMIXOUT2)\text{image}}}$

TEF6721HL

12 I²C-BUS PROTOCOL**12.1 I²C-bus specification**

SDA and SCL HIGH and LOW levels are specified according to a 3.3 V I²C-bus. The bus pins tolerate also thresholds of a 5 V bus.

The standard I²C-bus specification is expanded by the following definitions.

IC addresses:

- 1st IC address C2H: 1100001 R \overline{W}
- 2nd IC address C0H: 1100000 R \overline{W}
- 3rd IC address C4H: 1100010 R \overline{W} .

Structure of the I²C-bus logic: slave transceiver with auto increment.

Subaddresses are not used.

The second I²C-bus address can be selected by connecting pin ADDRSEL via a 120 k Ω resistor to GND. The third I²C-bus address can be selected by connecting pin ADDRSEL via a 33 k Ω resistor to GND.

The maximum bit rate for this device is 100 kbits/s.

The I²C-bus interface is extended with an enable input (pin BUSENABLE). If pin BUSENABLE is HIGH the communication with the device is active; if pin BUSENABLE is LOW the signals on the I²C-bus are ignored so that higher bit rates (>100 kbits/s) can be used to communicate with other devices on the same I²C-bus. The enable signal must not change while bus communication takes place.

No default settings at power-on reset. I²C-bus transmission is required to program the IC.

12.1.1 DATA TRANSFER

Data sequence: address, byte 0, byte 1, byte 2, byte 3, byte 4 and byte 5.

The data transfer has to be in this order. The LSB of the address being logic 0 indicates a write operation.

Bit 7 of each byte is considered the MSB and has to be transferred as the first bit of the byte.

The data becomes valid at the output of the internal latches with the acknowledge of each byte. A STOP condition after any byte can shorten transmission times.

When writing to the transceiver by using the STOP condition before completion of the whole transfer:

- The remaining bytes will contain the old information
- If the transfer of a byte is not completed, this byte is lost and the previous information is available.

12.1.2 FREQUENCY SETTING

For new frequency setting, in both AM and FM mode, the programmable divider is enabled by setting bit PRESET to logic 1. To select a frequency, two I²C-bus transmissions are necessary:

- First: bit PRESET = 1
- Second: bit PRESET = 0.

12.2 I²C-bus protocol**12.2.1 DATA TRANSFER MODE AND IC ADDRESS****Table 1** Write mode

S ⁽¹⁾	address (write)	A ⁽²⁾	data byte(s)	A ⁽²⁾	P ⁽³⁾
------------------	-----------------	------------------	--------------	------------------	------------------

Table 2 Read mode

S ⁽¹⁾	address (read)	A ⁽²⁾	data byte 0	NA ⁽⁴⁾	P ⁽³⁾
------------------	----------------	------------------	-------------	-------------------	------------------

Notes

1. S = START condition.
2. A = acknowledge.
3. P = STOP condition.
4. NA = no acknowledge.

Table 3 IC address byte

ADDRESS	IC ADDRESS ⁽¹⁾							MODE ⁽²⁾
1	1	1	0	0	0	0	1	R \overline{W}
2	1	1	0	0	0	0	0	R \overline{W}
3	1	1	0	0	0	1	0	R \overline{W}

Notes

1. Pin ADDRSEL left open-circuit activates 1st IC address; R_{ext} = 120 k Ω at pin ADDRSEL to ground activates 2nd IC address; R_{ext} = 33 k Ω at pin ADDRSEL to ground activates 3rd IC address.
2. Read or write bit:
0 = write operation to TEF6721HL
1 = read operation from TEF6721HL.

16 SOLDERING

16.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

16.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 220 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA and SSOP-T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 235 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

16.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

16.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

Car radio tuner front-end for digital IF

TEF6721HL

16.5 Suitability of surface mount IC packages for wave and reflow soldering methods

PACKAGE ⁽¹⁾	SOLDERING METHOD	
	WAVE	REFLOW ⁽²⁾
BGA, LBGA, LFBGA, SQFP, SSOP-T ⁽³⁾ , TFBGA, VFBGA	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSQFP, HSOP, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable ⁽⁴⁾	suitable
PLCC ⁽⁵⁾ , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended ⁽⁵⁾⁽⁶⁾	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended ⁽⁷⁾	suitable
PMFP ⁽⁸⁾	not suitable	not suitable

Notes

- For more detailed information on the BGA packages refer to the “(LF)BGA Application Note” (AN01026); order a copy from your Philips Semiconductors sales office.
- All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the “Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods”.
- These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding $217\text{ °C} \pm 10\text{ °C}$ measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- Wave soldering is suitable for LQFP, TQFP and QFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- Hot bar or manual soldering is suitable for PMFP packages.

17 DATA SHEET STATUS

LEVEL	DATA SHEET STATUS ⁽¹⁾	PRODUCT STATUS ⁽²⁾⁽³⁾	DEFINITION
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.
3. For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

18 DEFINITIONS

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

19 DISCLAIMERS

Life support applications — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
