Chip Ferrite Beads BLM18 Series

BLM18A Series

Features

The chip ferrite beads BLM series is designed to function nearly as a resistor at noise frequencies, which greatly reduces the possibility of resonance and leaves signal wave forms undistorted. The BLM series is effective in circuits without stable ground lines because the BLM series does not need a connection to ground.

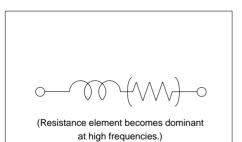

The nickel barrier structure of the external electrodes provides excellent solder heat resistance. BLM_A series generates an impedance from the relatively low frequencies. Therefore BLM_A series is effective in noise suppression in a wide frequency range (30MHz to several hundred MHz).

BLM18B Series

Features

The chip ferrite beads BLM series is designed to function nearly as a resistor at noise frequencies, which greatly reduces the possibility of resonance and leaves signal wave forms undistorted.

The BLM series is effective in circuits without stable ground lines because the BLM series does not need a connection to ground.

The nickel barrier structure of the external electrodes provides excellent solder heat resistance. The BLM_B series can minimize attenuation of the signal waveform due to its sharp impedance characteristics. Various impedances are available to match signal frequency.

BLM18P Series

Features

1

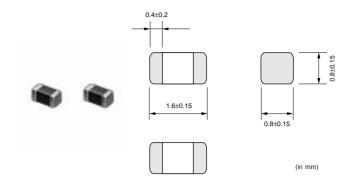

The chip ferrite beads BLM series is designed to function nearly as a resistor at noise frequencies, which greatly reduces the possibility of resonance and leaves signal wave forms undistorted.

The BLM series is effective in circuits without stable ground lines because the BLM series does not need a connection to ground.

The nickel barrier structure of the external

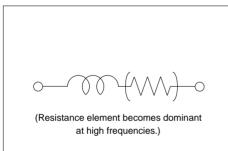

electrodes provides excellent solder heat resistance.

The BLM_P series can be used in high current circuits due to its low DC resistance.

■ Notice (Rating)

In operating temperatures exceeding +85°C, derating of current is necessary for chip Ferrite Beads for which rated current is 1500mA or over. Please apply the derating curve shown in chart according to the operating temperature.

Test and Measurement Conditions

<Unless otherwise specified> Temperature: Ordinary Temp. 15 to 35°C Humidity: Ordinary Humidity 25 to 85%(RH) <In case of doubt> Temperature: 20±2°C Humidity: 60 to 70%(RH) Atmospheric pressure: 86 to 106kPa

■ Specifications

1

1. Electrical Performance

No.	Item	Specifications	Test Methods
1	Impedance	Meet rating table above Impedance frequency Characteristics (Typical): see the appendix.	Measuring Equipment: Agilent 4291A or the equivalent Measuring Frequency: 100±1MHz Test Fixture: Agilent 16092A or the equivalent (for BLM18BADDSH1D type: Agilent 16192A or the equivalent)
2	DC Resistance	Meet rating table above.	Measuring Equipment: Digital multi-meter

2. Mechanical Performance

No.	Item	Specifications	Test Methods
1	Appearance and Dimensions	Meet dimensions.	Visual Inspection and measured with Slide Calipers.
2	Solderability	The electrodes should be at least 95% covered with new solder coating.	Flux: Ethanol solution of rosin, 25wt% Pre-heating: 150±5°C, 60±5s Solder: (1) Sn/Pb=60/40 (2) Sn-3.0Ag-0.5Cu solder Solder Temperature: (1) 230±5°C (2) 240±5°C Immersion Time: (1) 4±1s (2) 3±1s Immersion and emersion rates: 25mm/s
3	Resistance to Soldering Heat	Meet Table 1.	Flux: Ethanol solution of rosin, 25wt% Pre-heating: 150±5°C, 60±5s Solder: Sn/Pb=60/40 or Sn-3.0Ag-0.5Cu solder Solder Temperature: 270±5°C Immersion Time: 10±0.5s Immersion and emersion rates: 25mm/s Then measured after exposure to room conditions for 48±4 hrs.
4	Bonding Strength		It should be soldered on the substrate. Applying Force (F): 6.8N (Side view) Applying Time: 5±1s
5	Bending Strength		It should be soldered on the glass-epoxy substrate. Subatrate: 100 x 40 x 1.6mm Deflection (n): 1.0mm (Glass-epoxy substrate) Speed of Applying Force: 0.5mm/s Keeping Time: 30s Pressure jig Pressure jig Deflection 45mm - Product
6	Vibration		It should be soldered on the substrate. Oscillation Frequency: 10 to 2000 to 10Hz for 20 min. Total Amplitude: 1.5mm or Acceleration amplitude 49m/s ² whichever is smaller. Testing Time: A period of 2 hours in each of 3 mutually perpendicular directions. (Total 6 hrs.)

On-Board Type (DC) EMI Suppression Filters (EMIFIL®) for Automotive

Chip EMIFIL[®] Capacitor Type NFM21H Series

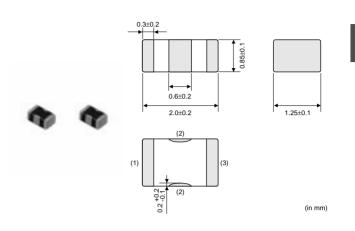

The chip "EMIFIL" NFM21H series is a chip type three terminal EMI suppression filter. It can reduce residual inductance to an extremely low level making it excellent for noise suppression at high frequencies.

Features

- 1. Wide operating temperature range. (-55 to +125 degree C)
- 2. Three terminal structure enables high performance in high frequency range.
- 3. Uses original electrode structure which realizes excellent solderability.
- 4. An electrostatic capacitance range of 22 to 22000pF enables suppression of noise at specific frequencies.

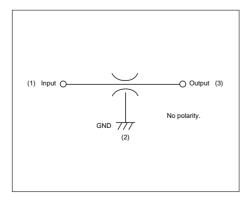

Applications

Severe EMI suppression and high impedance circuits such as digital circuits.

On-Board Type (DC) EMI Suppression Filters (EMIFIL®) for Automotive

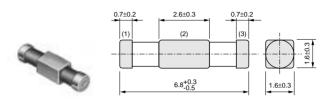

Chip EMIFIL[®] LC Combined Type for Large Current NFE61H Series

2

The T-type chip EMI Filter NFE61H series consists of a feedthrough capacitor and ferrite beads.

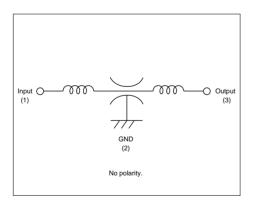

- Features
- 1. Its large rated current of 2A and low voltage drop due to small DC resistance are suitable for DC power line use.
- 2. The feedthrough capacitor realizes excellent high frequency characteristics.
- 3. The structure incorporates built-in ferrite beads which minimize resonance with surrounding circuits.
- 4. 33 to 3300pF lineups can be used signal lines.

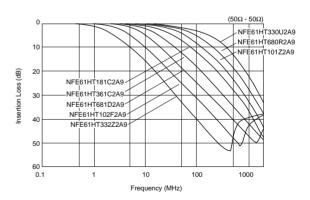

(in mm)

Chip Common Mode Choke Coil DLW31S Series

The DLW31SH series is a high performance wound type chip common mode choke coil.

Features

- 1. DLW31SH is the small size. (3.2x1.6x1.9mm)
- 2. Suitable for noise suppression at car area networks like CAN (Controller Area Network) bus.
- DLW31SH has high common mode impedance so it is suitable for noise suppression through wide frequency range.
- 4. Wide operating temperature range. (-40 to +125 degree C)

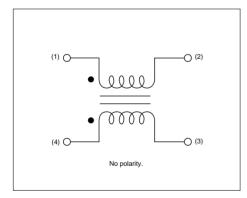

Noise suppression at car area networks like CAN bus or Car navigation system.

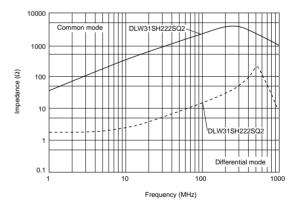

Part Number	Common Mode Impedance (at 100MHz, 20°C) (ohm)	Rated Current (mA)	Rated Voltage (Vdc)	Insulation Resistance (min.) (M ohm)	Withstand Voltage (Vdc)	DC Resistance (ohm)

4. Test Terminal (When measuring and supplying the voltage, the following terminal is applied.)

No.	Item	Terminal to be Tested
1	Common Mode Impedance (Measurement Terminal)	Terminal O
2	Withstanding Voltage (Measurement Terminal)	
3	DC Resistance (Measurement Terminal)	Terminal O
4	Insulation Resistance (Measurement Terminal)	Terminal O
5	Heat Life (Supply Terminal)	Terminal O

■ Measuring Method for Common Mode Impedance Measured common mode impedance may include

measurement error due to stray capacitance, residual inductance of test fixture.

To correct this error, the common mode impedance should be calculated as follows;

- (1) Measure admittance of the fixture (opened), Go Bo.
- (2) Measure impedance of the fixture (shorted), Rs Xs.
- (3) Measure admittance of the specimen, Gm Bm.
- (4) Calculate corrected impedance |Z| using the formula below.

$$|Z| = (Rx^2 + Xx^2)^{1/2}$$

Where

$$Rx = \frac{Gm - Go}{(Gm - Go)^{2} + (Bm - Bo)^{2}} - Rs$$
$$Xx = \frac{-(Bm - Bo)}{(Gm - Go)^{2} + (Bm - Bo)^{2}} - Xs$$

Caution/Notice

■ ①Caution (Rating)

Do not use products beyond the rated current and rated voltage as this may create excessive heat and deteriorate the insulation resistance.

■ △Caution (Soldering and Mounting)

Please provide special attention when mounting chip "EMIFIL" (BLM_P) series in close proximity to other products that radiate heat.

The heat generated by other products may deteriorate the insulation resistance and cause excessive heat in this component.

■ Notice (Storage and Operating Condition)

- < Operating Environment >
- Do not use products in a chemical atmosphere such as chlorine gas, acid or sulfide gas.
- < Storage and Handling requirements >
- 1. Storage Period

BLM series should be used within 6 months, the other series should be used within 12 months. Products to be used after this period should be checked for solderability.

■ Notice (Rating)

Noise suppression levels resulting from Murata's EMI suppression filters "EMIFIL" may vary, depending on the circuits and ICs used, type of noise, mounting pattern, lead wire length, mounting location, and other operating conditions. Be sure to check and confirm in advance the noise suppression effect of each filter, in actual circuits, etc. before applying the filter in a commercial-purpose equipment design.

■ Notice (Soldering and Mounting)

1. Washing

Failure and degradation of a product are caused by the washing method. When you wash on the conditions that are not in mounting information, please contact Murata engineering.

2. Soldering

Reliability decreases with improper soldering methods. Please solder by the standard soldering conditions shown in mounting information.

■ Notice (Handling)

Do not make any resin coating DLW31SH series. Resin coating may cause a change in impedance value or open circuit of wire.

2. Storage conditions

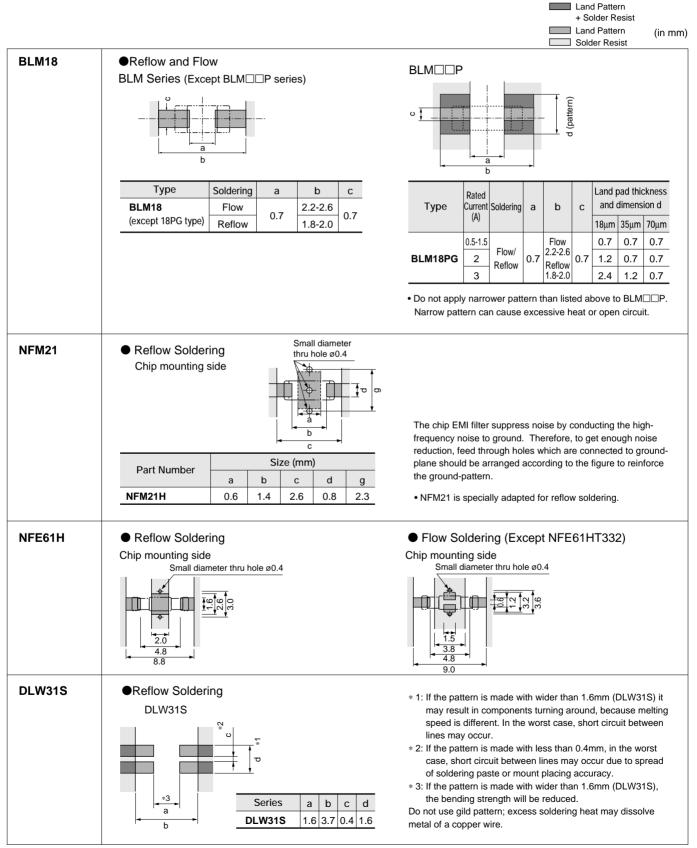

- (1) Storage temperature : -10 to 40 degree C Relative humidity : 30 to 70%
- Avoid sudden changes in temperature and humidity.
- (2) Do not store products in a chemical atmosphere such as chlorine gas, acid or sulfide gas.

1. Standard Land Pattern Dimensions

NF series suppress noise by conducting the high-frequency noise element to ground. Therefore, to obtain maximum performance from these filters, the ground pattern should be made as large as possible during the PCB design stage. As shown in the right, one side of the PCB is used for chip mounting, and the other is used for grounding.

Small diameter feedthrough holes are then used to connect the grounds on each side of the PCB. This reduces the high-frequency impedance of the grounding and maximizes the filter's performance.

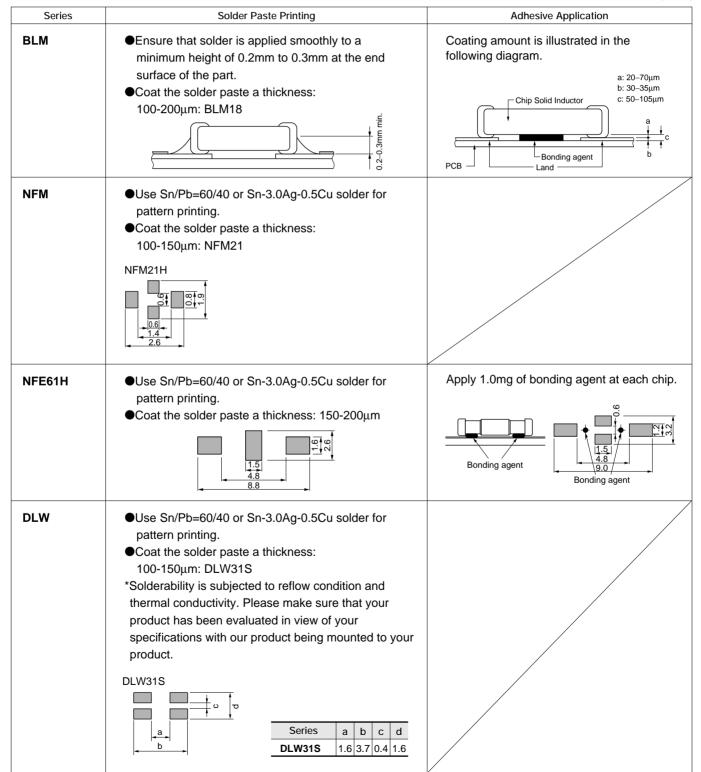

Continued from the preceding page.

2. Solder Paste Printing and Adhesive Application When reflow soldering the chip EMI suppression filter, the printing must be conducted in accordance with the following cream solder printing conditions. If too much solder is applied, the chip will be prone to damage by mechanical and thermal stress from the PCB and may crack. In contrast, if too little solder is applied, there is the potential that the termination strength will be insufficient, creating the potential for detachment. Standard land dimensions should be used for resist and

copper foil patterns.

When flow soldering the EMI suppression filter, apply the adhesive in accordance with the following conditions. If too much adhesive is applied, then it may overflow into the land or termination areas and yield poor solderability. In contrast, if insufficient adhesive is applied, or if the adhesive is not sufficiently hardened, then the chip may become detached during flow soldering process.

(in mm)

 \fbox Continued from the preceding page.

3. Standard Soldering Conditions

(1) Soldering Methods

Use flow and reflow soldering methods only. Use standard soldering conditions when soldering chip EMI suppression filters. In cases where several different parts are soldered, each having different soldering conditions, use those

conditions requiring the least heat and minimum time.

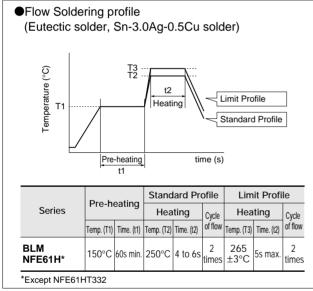

Solder : H60A H63A solder (JIS Z 3238)

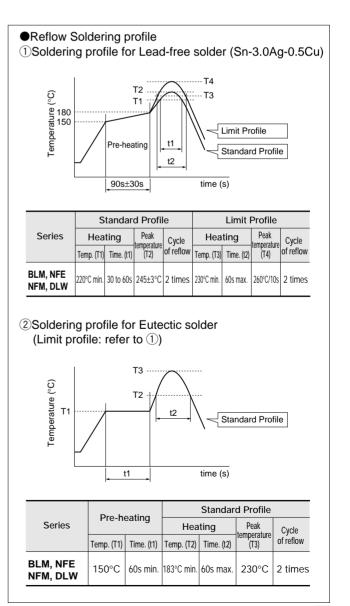

In case of lead-free solder, use Sn-3.0Ag-0.5Cu solder

Flux :

- Use Rosin-based flux (when using RA type solder, clean products sufficiently to avoid residual flux.
- Do not use strong acidic flux (with chlorine content exceeding 0.20wt%)
- Do not use water-soluble flux.

(2) Soldering profile

Continued on the following page.

Continued from the preceding page

(3) Reworking with Solder Iron
The following conditions must be strictly followed when
using a soldering iron.
Pre-heating: 150°C 60s min.
Soldering iron power output: 30W max.
Temperature of soldering iron tip / Soldering time:
280°C max./10s max. or 300°C max./3s max.*
*BLM: 350°C max./3s max.
Do not allow the tip of the soldering iron to directly
contact the chip.
For additional methods of reworking with to soldering iron

For additional methods of reworking with to soldering iron, please contact Murata engineering.

4. Cleaning

Following conditions should be observed when cleaning chip EMI filter.

- (1) Cleaning Temperature: 60°C max. (40°C max. for alcohol type cleaner)
- (2) UltrasonicOutput: 20W/liter max.Duration: 5 minutes max.

Frequency: 28 to 40kHz

(3) Cleaning agent

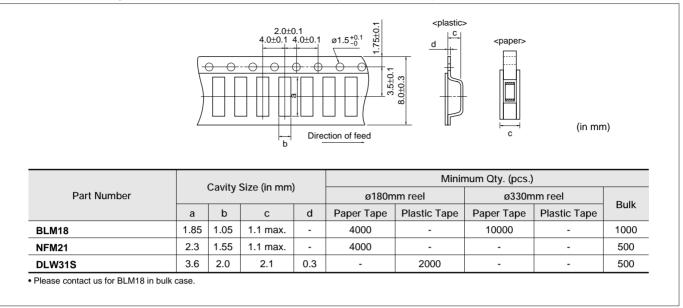

The following list of cleaning agents have been tested on the individual components. Evaluation of final assembly should be completed prior to production. Do not clean DLW31S series. In case of cleaning, please contact Murata engineering. (a) Alcohol cleaning agent

- Isopropyl alcohol (IPA) (b) Aqueous cleaning agent
- Pine Alpha ST-100S (4) Ensure that flux residue is completely removed. Component should be thoroughly dried after aqueous agent has been removed with deionized water.
- (5) Some products may become slightly whitened.
 However, product performance or usage is not affected.
 For additional cleaning methods, please contact Murata engineering.

*1 Electrical Appliance and Material Safety Law

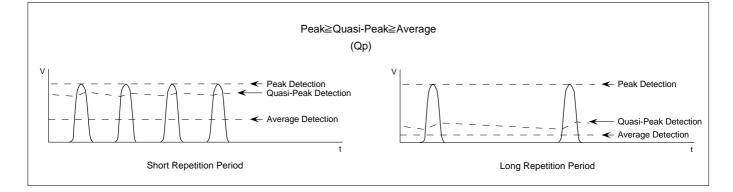

There are EMI regulations in each country to meet EMI noise levels emitted from digital equipment. In the countries which regulate EMI, equipment which does not satisfy regulations is not allowed to be sold.

Continued from the preceding page.

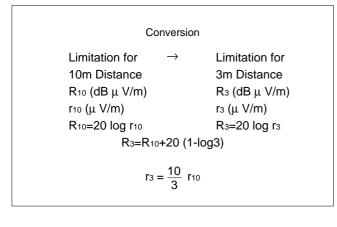

2. Measurement Point and Noise Detection

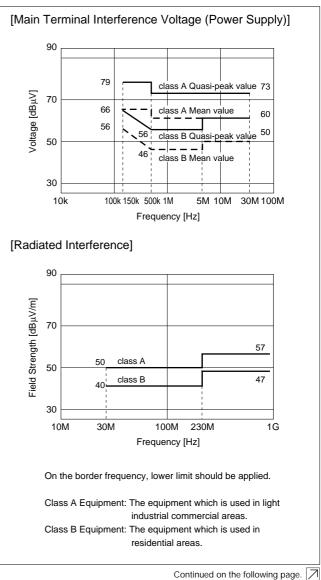

Regulation	Measuring Item	Polarization and Measuring Point	Frequency (Hz)	Detection	Measuring Devices
CISPR 22/	Radiated Interference	Horizontal Pol. Vertical Pol.	30M to 1GHz	Quasi-Peak Detection	Antenna
EN55022	Main Interference Voltage	AC Main Ports	150k to 30MHz	Quasi-Peak Detection Mean Detection	Artificial Main Network
VCCI	Radiated Interference	Horizontal Pol. Vertical Pol.	30M to 1GHz	Quasi-Peak Detection	Dipole Antenna
VCCI	Main Interference Voltage	AC Main Ports	150k to 30MHz	Quasi-Peak Detection Mean Detection	Artificial Main Network
FCC Part 15	Radiated Interference	Horizontal Pol. Vertical Pol.	30M to 40GHz	Quasi-Peak Detection Mean Detection	Antenna
FUC Part 15	Main Interference Voltage	AC Main Ports	150k to 30MHz	Quasi-Peak Detection	Artificial Main Network

3. Limits of CISPR 22/EN55022

 CISPR 22 recommends measurement at 10m distance. However, other distance is acceptable if the limitation is converted according to the following calculation. Limitation shown left is converted to limitation for 3m distance.

- Continued from the preceding page.
- (2) Scope of CISPR 22 Regulation
 This regulation applies to information technology equipment (ITE) which are defined as:
 - (a) Equipment that receives data from external signal sources;
 - (b) Equipment that processes received data;
 - (c) Equipment that outputs data; and
 - (d) Equipment that has less than 600V rated voltage in power supply

4. Limits of VCCI Voluntary Regulation

VCCI recommends measurement at 10m distance;
 3m or 30m distance measurements are also allowed.

(2) Scope of VCCI Voluntary Regulation

This regulation applies to information technology equipment (same as CISPR Pub.22), but the application is excluded on the following equipment:

- Equipment for which other regulations already exist (e.g., household electrical appliances, radio and TV receivers)
- In station equipment principal purpose of which is electrical communication
- Industrial plant control system for which information processing is a secondary system function
- Industrial, commercial and medical testing and measuring systems for which data processing is a secondary system function
- Information equipment for which CISPR is conducting further deliberation

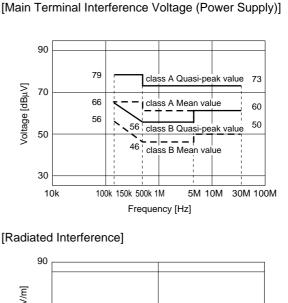

VCCI is the acronym of Voluntary Control Council for Interference by Data Processing Equipment and Electronic Office Machines.

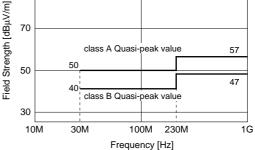

VCCI is organized by the following organizations:

- Japan Electronics and Information Technology Industries Association (JEITA)
- Japan Business Machine and Information System Industries Association (JBMIA)
- Communication and Information Network Association of Japan (CIAJ)

[CISPR Regulations]

CISPR 10 Organization, Regulations and Procedures of CISPR CISPR 11 Industrial, Scientific and Medical (ISM) Radio-Frequency

On the border frequency, lower limit should be applied.

Class B ITE: Equipment that designed to be used at home. Class A ITE: Equipment that does not meet interference limits of class B equipment, but satisfies interference limits of class A equipment.

Continued on the following page.

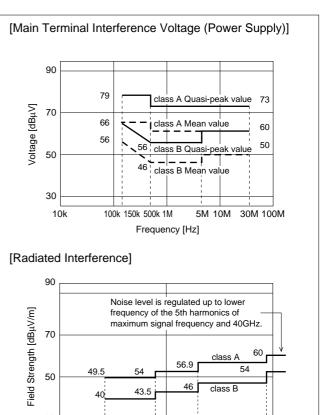

Continued from the preceding page.

5. Limits of FCC Part 15 Subpart B

- (1) Class A recommend to be measured with 10m distance. Class B recommend to be measured with 3m distance.
- (2) The FCC Part 15 regulation controls radiated
- interference by establishing quasi-peak and mean value limits for fre-quencies ranging from 30MHz to 40GHz (or maximum frequency's fifth harmonic, whichever is lower). For AC main ports, the FCC Part 15 regulation controls main terminal interference voltage by establishing quasipeak value limits for frequencies ranging from 450kHz to 30MHz.

Measurement Frequency Range for Radiated Interference

Maximum Frequency the Equipment Internally Generates, Uses or Operates or Synchronizes (MHz)	Upper End of Measurement Frequency Range (MHz)	
Less than 1.705	30	
1.705 to 108	1000	
108 to 500	2000	
500 to 1000	5000	
Over 1000	Maximum Frequency's Fifth Harmonic or 40GHz, Whichever is Lower	

30 10M 30M 88M100M 216M 960M1G Frequency [Hz]

On the border frequency, lower limit should be applied.

Class A Equipment: The digital equipment that is sold for commercial, industrial and office use. Class B Equipment: The digital equipment that is sold to be used in residential areas.

(3)There is no regulation on power interference.

Continued from the preceding page.

6. Immunity Regulations in Europe Union

All electric/electronic equipment cannot be sold in Europe without CE marking. To use CE marking, they must satisfy related EC directives such as EMC directives. For Information Technology Equipment, in EMC directive, emission regulations are integrated, and immunity regulations are applied. Although these immunity regulations are prepared by CENELEC, almost all contents are same as standards issued by IEC or CISPR.

All products which are sold in EU must satisfy EC directive which contains immunity regulation.

Principal EC Directive

EMC Directive	89/336/EEC 92/31/EEC	
Low-Voltage Electrical Products Directive	73/23/EEC	
Machines Directive	89/392/EEC	

7. Immunity Regulations in Japan

Equipment	Association
TV, Radio, Audio	IFITA (Japan Flastranics and Information Tachnology)
ITE	JEITA (Japan Electronics and Information Technology)
Office Machine	JBMIA (Japan Business Machine and Information System Industries Association)
Mi	CIAJ (Communication and Information Network Association of Japan) ARIB (Association of Radio Industries and Business)
Machine To Builders	JMTBA (Japan Machine Tool Builders' Association)
Industrial Measuring Control Equipment	JEMIMA (Japan Electric Measuring Instruments Manufacturers' Association)
Industrial Robot	JARA (Japan Robot Association)

The table on the right shows the preparation situation of JIS for EMC. At this moment, the immunity standards by JIS does not have a legal force like Electrical Application and Material Safety Law/VCCI.

Noise Suppression Principles by DC EMIFIL®

1. Function of DC EMI Suppression Filters

DC EMI suppression filters absorb and eliminate high frequency noise which may produce electromagnetic interference in PC board circuits.

These filters are used in secondary circuits, and are small in size and light in weight, which further enhances their excellent noise suppression functions.

Chip and adhesive type filters can be mounted on PC boards automatically.

These filters are effective in the suppression of radiation noise in computers, peripheral equipment, and digital circuit application equipment (including various types of microcomputer application equipment), and function to suppress noise in audio/visual equipment, which uses digital memory chips and DSP.

These filters are also effective for improving the noise immunity of equipment used in noisy environments (such as electronic equipment for automobiles).

2. Noise Filter Suppression Principles

Generally, noise problems occur when the noise source and electronic equipment sensitive to the influence of noise are located in close proximity to one another. In such situations, as shown in Figure at right, noise is conducted through a conductor, which produces an inductive field around the noise source.

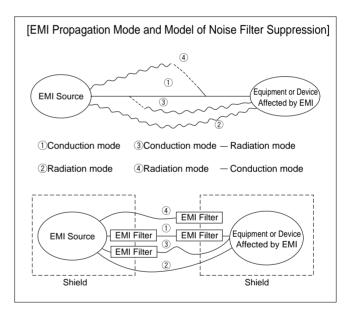

To overcome such noise problems, it is preferable to reduce the amount of noise generated by the noise source or improve the noise resistance of adjacent equipment.

In order to satisfy equipment performance specifications and eliminate noise effectively at the same time, however, it is customary to reduce the amount of noise generated by the noise source, if it can't be eliminated altogether.

3. Configuration of EMI Suppression Filters (DC) DC EMI suppression filters are used to suppress noise produced by conductors. Noise radiation can be suppressed, if it is eliminated with a filter in advance. Generally, such noise suppression is achieved with DC EMI suppression filters, according to the capacitive and inductive frequency characteristics of the respective conductors in the circuit.

Filters of this kind can be roughly divided into those:

- (1) employing a capacitor,
- (2) employing an inductor,
- (3) employing a capacitor and inductor combination.

Noise Suppression Principles by DC EMIFIL®

Continued from the preceding page.

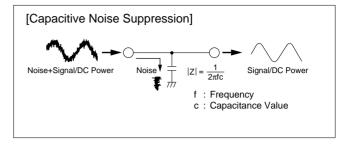

4. Capacitive Noise Suppression

When a capacitor is connected (bypass capacitor) to ground from a noisy signal line or power line, the circuit impedance decreases as the frequency increases. Since noise is a high frequency phenomenon, it flows to ground if a capacitor has been connected to ground, thereby making it possible to eliminate noise. (See Fig.) EMI suppression filters employing a capacitor in this way are used to eliminate this type of noise.

5. High frequency Capacitor Characteristics Used for EMI Suppression Filters

Even general-purpose capacitors can be used for noise suppression. However, since noise has an extremely high frequency range, general-purpose capacitors may not function as effective bypass capacitors, due to the large residual inductance built into the capacitor.

All the capacitors used in Murata's EMI suppression filters employ a three terminal structure or thru-type structure, which functions effectively even at high frequencies, thereby minimizing the influence of residual inductance. Consequently, an effective filter circuit can be formed even at frequencies exceeding 1GHz. (Refer to Fig.)

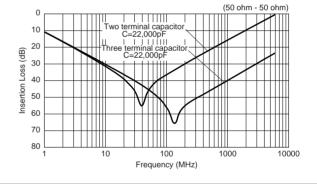

[Equivalent circuit of general-purpose capacitor and three terminal capacitor in the high frequency area and comparison of insertion loss]

(a) Equivalent circuit of capacitors which is concerning ESL effect.

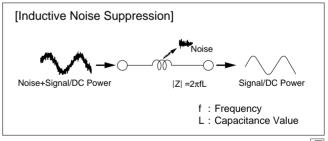

6. Inductive Noise Suppression

When an inductor is inserted in series in a noise producing circuit (See Fig.), its impedance increases with frequency. In this configuration it is possible to attenuate and eliminate noise components (high frequency components). The Murata EMI suppression filter functions in this way.

Continued on the following page. 🖊

Noise Suppression Principles by DC EMIFIL[®]

Continued from the preceding page.

7. Characteristics of Inductors Used

in EMI Suppression Filters

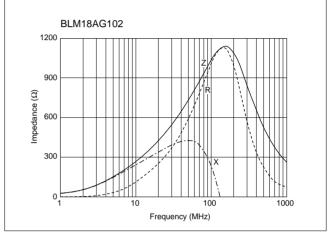

General-purpose inductors also function to suppress noise when configured in series with a noise producing circuit. However, when general-purpose inductors are used, resonance may result in peripheral circuits, signal wave forms may become distorted, and satisfactory impedance may not be obtained at noise frequencies (due to insufficient high frequency impedance characteristics).

The inductors used for Murata's EMI suppression filters are designed to function nearly as a resistor at noise frequencies, which greatly reduces the possibility of resonance and leaves signal wave forms undistorted. And since sufficient impedance is obtained for frequencies ranging to hundreds of MHz, these specifically designed inductors operate effectively to suppress high-frequency noise. (See Fig.) [Equivalent Circuit]

R(f)

(Resistance element becomes dominant at high frequency.)

8. Capacitive-Inductive EMI Suppression Filters If capacitive and inductive suppression characteristics are combined, it is possible to configure a much higher performance filter. In signal circuit applications where this combination is applied, noise suppression effects which have little influence on the signal wave form become possible.

This type of filter is also effective in the suppression of high-speed signal circuit noise. When used in DC power circuits, capacitive-inductive filters prevent resonance from occurring in peripheral circuits, thus making it possible to achieve significant noise suppression under normal service conditions.

9. Other EMI Suppression Filters

In addition to the capacitive-inductive filter, Murata also has a common mode choke coil, effective for common mode noise suppression.

Murata also has a range of built-in filter connectors which greatly reduce filter mounting space requirements.

Continued on the following page. \checkmark

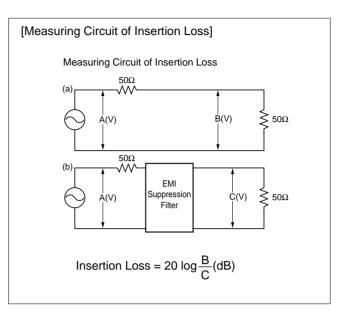

Noise Suppression Principles by DC EMIFIL®

Continued from the preceding page.

10. Expressing EMI Suppression Filter Effects EMI Suppression Filter effects are expressed in terms of the insertion loss measured in the circuit, normally specified in MIL-STD 220A. As shown in the 50Ω impedance circuit in the Figure at right, insertion loss is represented by the logarithmic ratio of the circuit output voltage with and without a filter in the circuit, which is multiplied by 20 and expressed in dB.

Therefore, an insertion loss of 20dB indicates an output voltage ratio (B/C) of 1/10, and an insertion loss of 40dB indicates an output voltage ratio (B/C) of 1/100.

△ Note:

1. Export Control (For customers outside Japan)

Murata products should not be used or sold for use in the development, production, stockpiling or utilization of any conventional weapons or mass-destructive weapons (nuclear weapons, chemical or biological weapons, or missiles), or any other weapons.

For products which are controlled items subject to the "Foreign Exchange and Foreign Trade Law" of Japan, the export license specified by the law is required for export.

- Please contact our sales representatives or product engineers before using the products in this catalog for the applications listed below, which require especially
 high reliability for the prevention of defects which might directly damage to a third party's life, body or property, or when one of our products is intended for use
 in applications other than those specified in this catalog.
 - 1 Aircraft equipment
 - 2 Aerospace equipment
 4 Power plant equipment
 - ③ Undersea equipment
 - 5 Medical equipment
- 6 Transportation equipment (vehicles, trains, ships, etc.)
- ⑦ Traffic signal equipment⑨ Data-processing equipment
 - 8 Disaster prevention / crime prevention equipment
 ① Application of similar complexity and/or reliability requirements to the applications listed in the above
- Product specifications in this catalog are as of September 2004. They are subject to change or our products in it may be discontinued without advance notice. Please check with our sales representatives or product engineers before ordering. If there are any questions, please contact our sales representatives or product engineers.
- 4. Please read rating and ACAUTION (for storage, operating, rating, soldering, mounting and handling) in this catalog to prevent smoking and/or burning, etc.
- 5. This catalog has only typical specifications because there is no space for detailed specifications. Therefore, please approve our product specifications or transact the approval sheet for product specifications before ordering.
- 6. Please note that unless otherwise specified, we shall assume no responsibility whatsoever for any conflict or dispute that may occur in connection with the effect of our and/or a third party's intellectual property rights and other related rights in consideration of your use of our products and/or information described or contained in our catalogs. In this connection, no representation shall be made to the effect that any third parties are authorized to use the rights mentioned above under licenses without our consent.
- 7. No ozone depleting substances (ODS) under the Montreal Protocol are used in our manufacturing process.
