■ TYPICAL APPLICATION

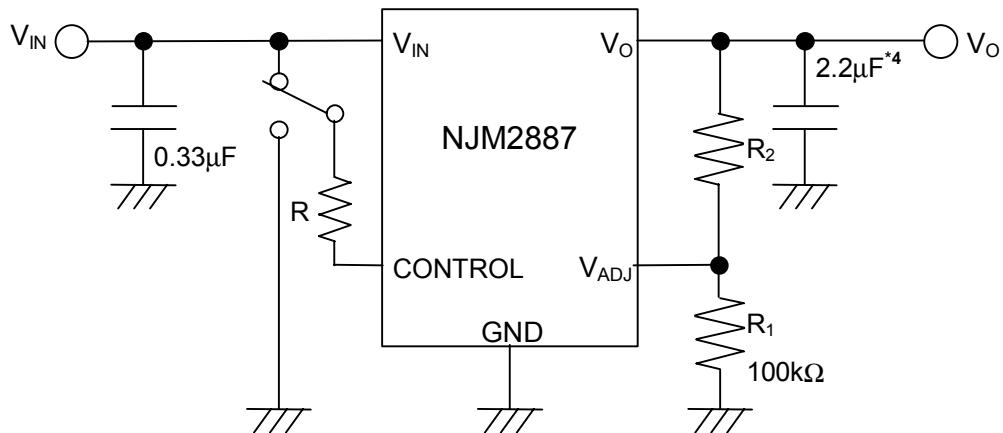

- ① In the case where ON/OFF Control is not required:

*4 $V_{O \leq 2.6V}$ version: $C_O = 4.7\mu F$

Connect control terminal to V_{IN} terminal

- ② In use of ON/OFF CONTROL:

*4 $V_{O \leq 2.6V}$ version: $C_O = 4.7\mu F$

State of control terminal:

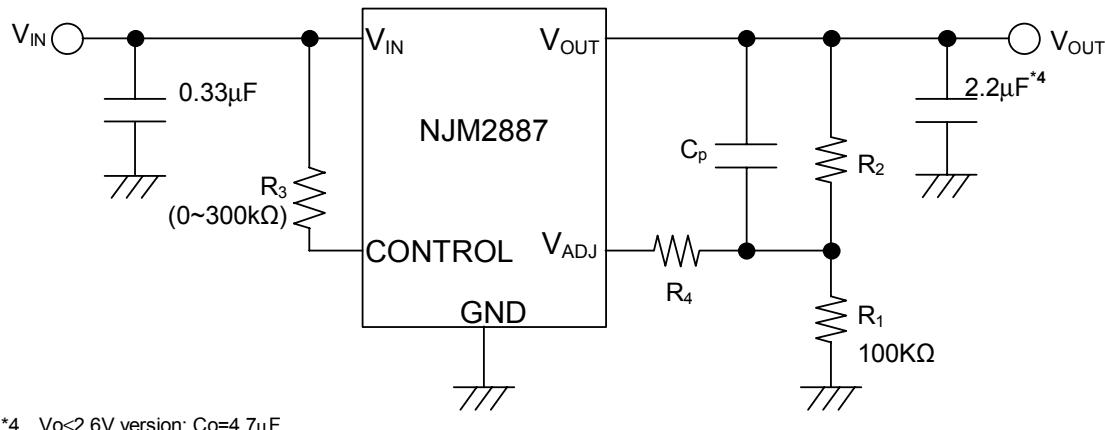

- "H" → output is enabled.
- "L" or "open" → output is disabled.

*In the case of using a resistance "R" between V_{IN} and control.

The current flow into the control terminal while the IC is ON state (I_{CONT}) can be reduced when a pull up resistance "R" is inserted between V_{IN} and the control terminal.

The minimum control voltage for ON state ($V_{CONT(ON)}$) is increased due to the voltage drop caused by I_{CONT} and the resistance "R". The I_{CONT} is temperature dependence as shown in the "Control Current vs. Temperature" characteristics. Therefore, the resistance "R" should be carefully selected to ensure the control voltage exceeds the $V_{CONT(ON)}$ over the required temperature range.

③ Reduction of output noise voltage:

*4 $V_{O \leq 2.6V}$ version: $C_O = 4.7\mu F$

Output feedback resistance: R_1 , should connect near V_{ADJ} terminal.

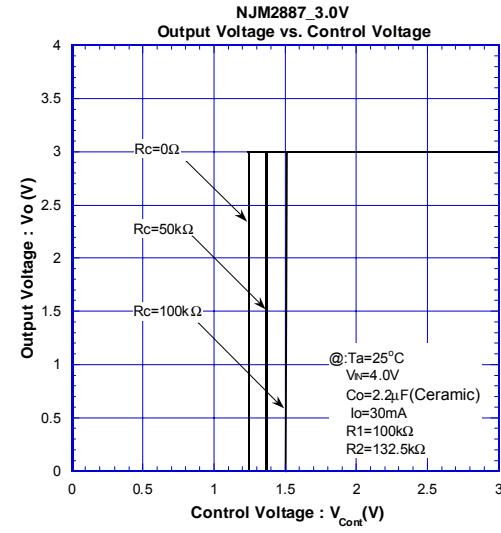

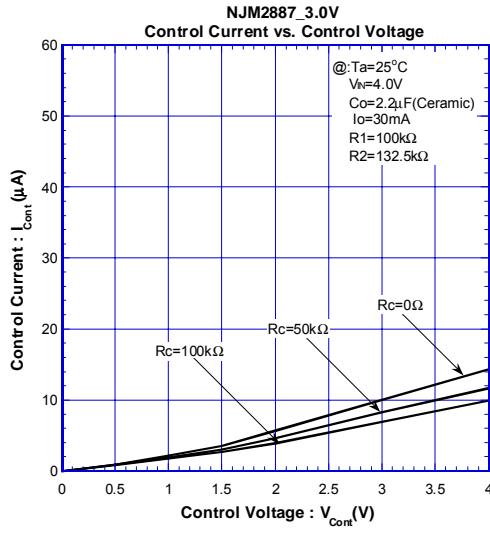

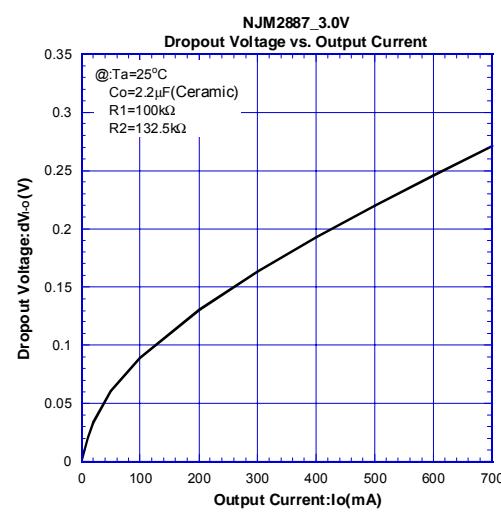

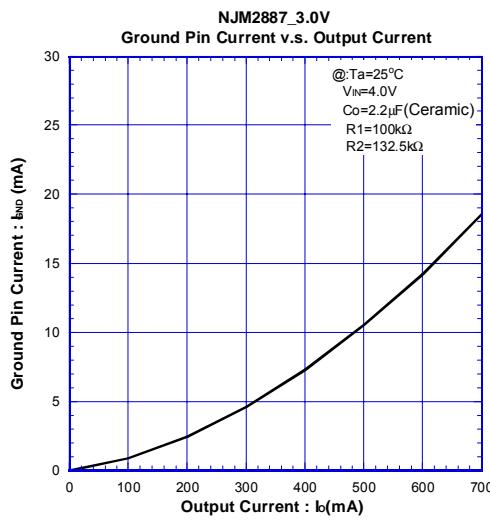

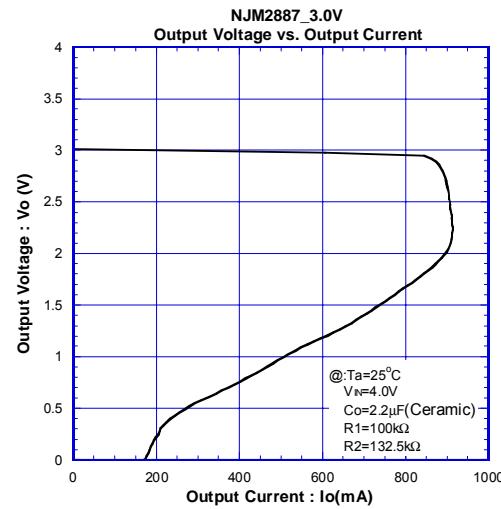

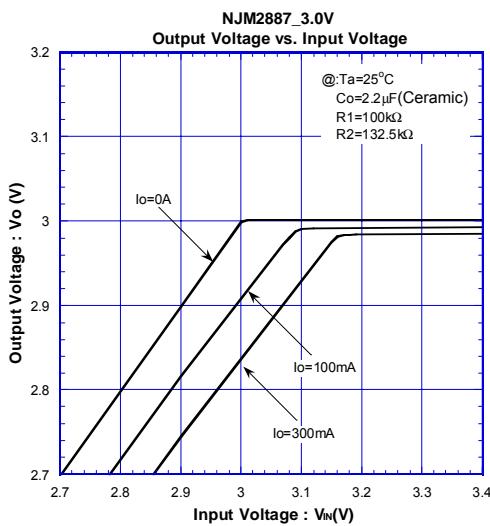

For reduce output noise voltage, connect C_p and R_4 refer to the following table.

The example of use of C_p and R_4

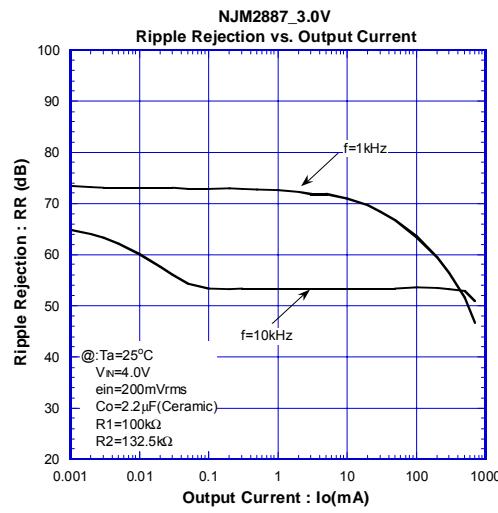

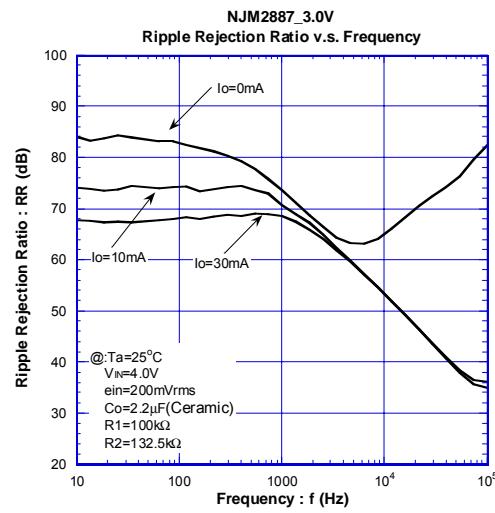

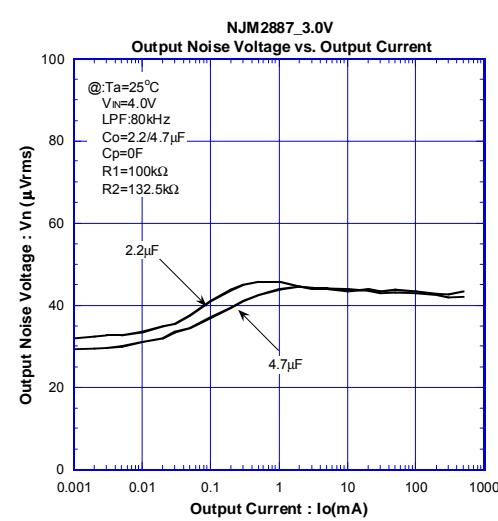

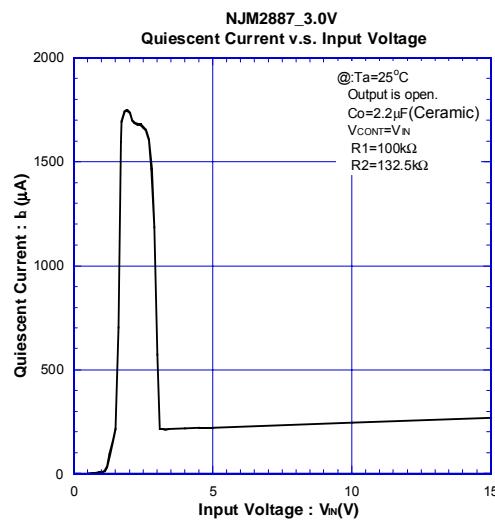

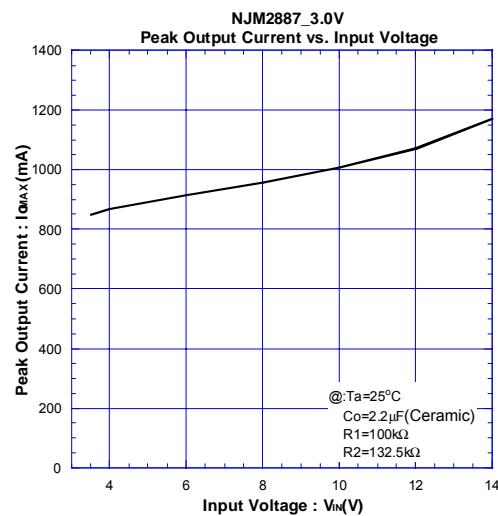

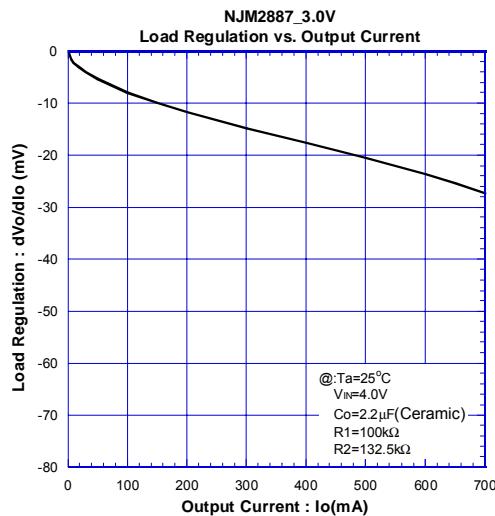

Output capacity value	$R_1=10k\Omega$	$R_1=1k\Omega$	$R_1=100\Omega$	R_4
$C_O=2.2\mu F$	$C_p=100pF$	$C_p=1nF$	$C_p=0.01\mu F$	$10k\Omega$ or less
$C_O=4.7\mu F$	$C_p=680pF$	$C_p=6.8nF$	$C_p=0.068\mu F$
