

3977

MICROSTEPPING DMOS DRIVER WITH TRANSLATOR

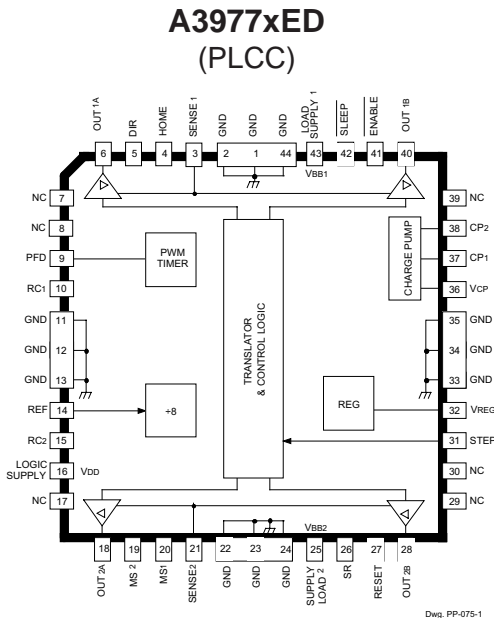

The A3977xED and A3977xLP are complete microstepping motor drivers with built-in translator. They are designed to operate bipolar stepper motors in full-, half-, quarter-, and eighth-step modes, with output drive capability of 35 V and ± 2.5 A. The A3977 includes a fixed off-time current regulator that has the ability to operate in slow-, fast-, or mixed-decay modes. This current-decay control scheme results in reduced audible motor noise, increased step accuracy, and reduced power dissipation.

The translator is the key to the easy implementation of the A3977. By simply inputting one pulse on the STEP input the motor will take one step (full, half, quarter, or eighth depending on two logic inputs). There are no phase-sequence tables, high-frequency control lines, or complex interfaces to program. The A3977 interface is an ideal fit for applications where a complex μ P is unavailable or over-burdened.

Internal synchronous-rectification control circuitry is provided to improve power dissipation during PWM operation.

Internal circuit protection includes thermal shutdown with hysteresis, under-voltage lockout (UVLO) and crossover-current protection. Special power-up sequencing is not required.

The A3977 is supplied in a choice of two power packages, a 44-pin plastic PLCC with copper batwing tabs (suffix ED), and a thin (<1.2 mm), 28-pin TSSOP with an exposed thermal pad (suffix LP). The SLP package is available in a lead-free version (100% matte tin leadframe).

ABSOLUTE MAXIMUM RATINGS at $T_A = +25^\circ\text{C}$

Load Supply Voltage, V_{BB}	35 V
Output Current, I_{OUT}	± 2.5 A*
Logic Supply Voltage, V_{DD}	7.0 V
Logic Input Voltage Range, V_{IN} ($t_w > 30$ ns)	-0.3 V to $V_{DD} + 0.3$ V
($t_w < 30$ ns)	-1 V to $V_{DD} + 1$ V
Sense Voltage, V_{SENSE}	0.5 V
Reference Voltage, V_{REF}	V_{DD}
Package Power Dissipation, P_D	See page 3
Operating Temperature Range, T_A (A3977Kx)	-40°C to +125°C
(A3977Sx)	-20°C to +85°C
Junction Temperature, T_J	+150°C
Storage Temperature Range, T_S	-55°C to +150°C

* Output current rating may be limited by duty cycle, ambient temperature, and heat sinking. Under any set of conditions, do not exceed the specified current rating or a junction temperature of 150°C.

FEATURES

- ± 2.5 A, 35 V Output Rating
- Low $r_{DS(on)}$ Outputs, 0.45 Ω Source, 0.36 Ω Sink Typical
- Automatic Current Decay Mode Detection/Selection
- 3.0 V to 5.5 V Logic Supply Voltage Range
- Mixed, Fast, and Slow Current Decay Modes
- Home Output
- Synchronous Rectification for Low Power Dissipation
- Internal UVLO and Thermal Shutdown Circuitry
- Crossover-Current Protection

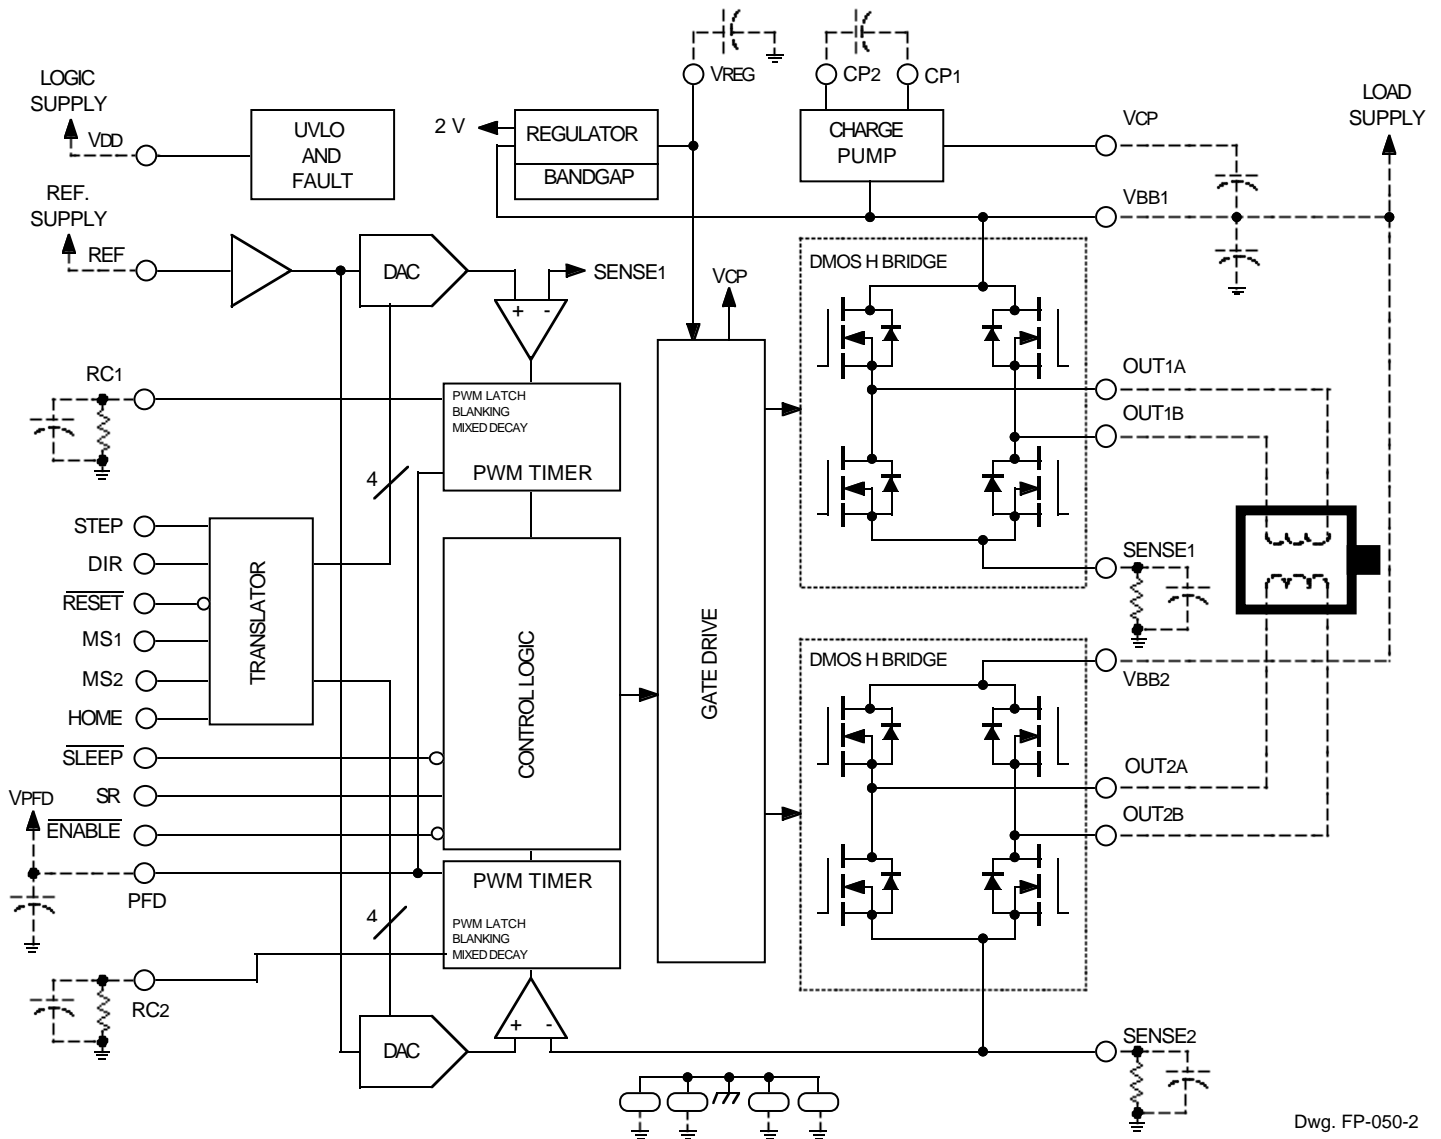

Part Number	Pb-free*	Package	Packing	Ambient Temperature, T_A (°C)
A3977KED-T	Yes	44-pin PLCC	27 per tube	-40 to 125
A3977KEDTR-T	Yes	44-pin PLCC	450 per reel	-40 to 125
A3977KLP-T	Yes	28-pin TSSOP	50 per tube	-40 to 125
A3977KLPTR-T	Yes	28-pin TSSOP	4000 per reel	-40 to 125
A3977SED-T	Yes	44-pin PLCC	27 per tube	-20 to 85
A3977SEDTR-T	Yes	44-pin PLCC	450 per reel	-20 to 85
A3977SLP-T	Yes	28-pin TSSOP	50 per tube	-20 to 85
A3977SLPTR-T	Yes	28-pin TSSOP	4000 per reel	-20 to 85

*Pb-based variants are being phased out of the product line. The variants cited in this footnote are in production but have been determined to be LAST TIME BUY. This classification indicates that sale of this device is currently restricted to existing customer applications. The variants should not be purchased for new design applications because obsolescence in the near future is probable. Samples are no longer available. Status change: October 31, 2006. Deadline for receipt to LAST TIME BUY orders: April 27, 2007. These variants include: A3977KED, A3977KEDTR, A3977KLP, A3977KLPTR, A3977SED, A3977SEDTR, A3977SLP, and A3977SLPTR.

* Operation at a step frequency greater than the specified minimum value is possible but not warranted.

NOTES: 1. Typical Data is for design information only.

2. Negative current is defined as coming out of (sourcing) the specified device terminal.

3. $E_G = ([V_{REF}/8] - V_{SENSE})/(V_{REF}/8)$

3977

MICROSTEPPING DMOS DRIVER WITH TRANSLATOR

Functional Description

Device Operation. The A3977 is a complete microstepping motor driver with built in translator for easy operation with minimal control lines. It is designed to operate bipolar stepper motors in full-, half-, quarter- and eighth-step modes. The current in each of the two output H-bridges, all n-channel DMOS, is regulated with fixed off time pulse-width modulated (PWM) control circuitry. The H-bridge current at each step is set by the value of an external current sense resistor (R_S), a reference voltage (V_{REF}), and the DAC's output voltage controlled by the output of the translator.

At power up, or reset, the translator sets the DACs and phase current polarity to initial home state (see figures for home-state conditions), and sets the current regulator for both phases to mixed-decay mode. When a step command signal occurs on the STEP input the translator automatically sequences the DACs to the next level (see table 2 for the current level sequence and current polarity). The microstep resolution is set by inputs MS_1 and MS_2 as shown in table 1. If the new DAC output level is lower than the previous level the decay mode for that H-bridge will be set by the PFD input (fast, slow or mixed decay). If the new DAC level is higher or equal to the previous level then the decay mode for that H-bridge will be slow decay. This automatic current-decay selection will improve microstepping performance by reducing the distortion of the current waveform due to the motor BEMF.

Reset Input (\overline{RESET}). The RESET input (active low) sets the translator to a predefined home state (see figures for home state conditions) and turns off all of the DMOS outputs. The HOME output goes low and all STEP inputs are ignored until the RESET input goes high.

Home Output (HOME). The HOME output is a logic output indicator of the initial state of the translator. At power up the translator is reset to the home state (see figures for home state conditions).

Step Input (STEP). A low-to-high transition on the STEP input sequences the translator and advances the motor one increment. The translator controls the input to the DACs and the direction of current flow in each winding. The size of the increment is determined by the state of inputs MS_1 and MS_2 (see table 1).

Microstep Select (MS_1 and MS_2). Input terminals MS_1 and MS_2 select the microstepping format per table 1. Changes to these inputs do not take effect until the STEP command (see figure).

Direction Input (DIR). The state of the DIRECTION input will determine the direction of rotation of the motor.

Internal PWM Current Control. Each H-bridge is controlled by a fixed off time PWM current-control circuit that limits the load current to a desired value (I_{TRIP}). Initially, a diagonal pair of source and sink DMOS outputs are enabled and current flows through the motor winding and R_S . When the voltage across the current-sense resistor equals the DAC output voltage, the current-sense comparator resets the PWM latch, which turns off the source driver (slow-decay mode) or the sink and source drivers (fast- or mixed-decay modes).

The maximum value of current limiting is set by the selection of R_S and the voltage at the V_{REF} input with a transconductance function approximated by:

$$I_{TRIPmax} = V_{REF}/8R_S$$

The DAC output reduces the V_{REF} output to the current-sense comparator in precise steps (see table 2 for % $I_{TRIPmax}$ at each step).

$$I_{TRIP} = (\% I_{TRIPmax}/100) \times I_{TRIPmax}$$

It is critical to ensure that the maximum rating (0.5 V) on the SENSE terminal is not exceeded. For full-step mode, V_{REF} can be applied up to the maximum rating of V_{DD} , because the peak sense value is $0.707 \times V_{REF}/8$. In all other modes V_{REF} should not exceed 4 V.

Functional Description (cont'd)

Fixed Off-Time. The internal PWM current-control circuitry uses a one shot to control the time the driver(s) remain(s) off. The one shot off-time, t_{off} , is determined by the selection of an external resistor (R_T) and capacitor (C_T) connected from the RC timing terminal to ground. The off time, over a range of values of $C_T = 470$ pF to 1500 pF and $R_T = 12$ k Ω to 100 k Ω is approximated by:

$$t_{\text{off}} = R_T C_T$$

RC Blanking. In addition to the fixed off time of the PWM control circuit, the C_T component sets the comparator blanking time. This function blanks the output of the current-sense comparator when the outputs are switched by the internal current-control circuitry. The comparator output is blanked to prevent false over-current detection due to reverse recovery currents of the clamp diodes, and/or switching transients related to the capacitance of the load. The blank time t_{BLANK} can be approximated by:

$$t_{\text{BLANK}} = 1400 C_T$$

Charge Pump. (CP₁ and CP₂). The charge pump is used to generate a gate supply greater than V_{BB} to drive the source-side DMOS gates. A 0.22 μF ceramic capacitor should be connected between CP₁ and CP₂ for pumping purposes. A 0.22 μF ceramic capacitor is required between V_{CP} and V_{BB} to act as a reservoir to operate the high-side DMOS devices.

V_{REG}. This internally generated voltage is used to operate the sink-side DMOS outputs. The V_{REG} terminal should be decoupled with a 0.22 μF capacitor to ground. V_{REG} is internally monitored and in the case of a fault condition, the outputs of the device are disabled.

Enable Input (ENABLE). This active-low input enables all of the DMOS outputs. When logic high the outputs are disabled. Inputs to the translator (STEP, DIRECTION, MS₁, MS₂) are all active independent of the ENABLE input state.

Shutdown. In the event of a fault (excessive junction temperature, or low voltage on V_{CP}) the outputs of the device are disabled until the fault condition is removed. At power up, and in the event of low V_{DD} , the under-voltage lockout (UVLO) circuit disables the drivers and resets the translator to the HOME state.

Sleep Mode (SLEEP). An active-low control input used to minimize power consumption when not in use. This disables much of the internal circuitry including the output DMOS, regulator, and charge pump. A logic high allows normal operation and startup of the device in the home position. When coming out of sleep mode, wait 1 ms before issuing a STEP command to allow the charge pump (gate drive) to stabilize.

Percent Fast Decay Input (PFD). When a STEP input signal commands a lower output current from the previous step, it switches the output current decay to either slow-, fast-, or mixed-decay depending on the voltage level at the PFD input. If the voltage at the PFD input is greater than $0.6V_{\text{DD}}$ then slow-decay mode is selected. If the voltage on the PFD input is less than $0.21V_{\text{DD}}$ then fast-decay mode is selected. Mixed decay is between these two levels. This terminal should be decoupled with a 0.1 μF capacitor.

Mixed Decay Operation. If the voltage on the PFD input is between $0.6V_{\text{DD}}$ and $0.21V_{\text{DD}}$, the bridge will operate in mixed-decay mode depending on the step sequence (see figures). As the trip point is reached, the device will go into fast-decay mode until the voltage on the RC terminal decays to the voltage applied to the PFD terminal. The time that the device operates in fast decay is approximated by:

$$t_{\text{FD}} = R_T C_T \ln(0.6V_{\text{DD}}/V_{\text{PFD}})$$

After this fast decay portion, t_{FD} , the device will switch to slow-decay mode for the remainder of the fixed off-time period.

3977 MICROSTEPPING DMOS DRIVER WITH TRANSLATOR

Functional Description (cont'd)

Synchronous Rectification. When a PWM off cycle is triggered by an internal fixed off-time cycle, load current will recirculate according to the decay mode selected by the control logic. The A3977 synchronous rectification feature will turn on the appropriate MOSFETs during the current decay and effectively short out the body diodes with the low $r_{DS(on)}$ driver. This will reduce power dissipation significantly and eliminate the need for external Schottky diodes for most applications.

The synchronous rectification can be set in either active mode or disabled mode.

Active Mode. When the SR input is logic low, active mode is enabled and synchronous rectification will occur. This mode prevents reversal of the load current by turning off synchronous rectification when a zero current level is detected. This prevents the motor winding from conducting in the reverse direction.

Disabled Mode. When the SR input is logic high, synchronous rectification is disabled. This mode is typically used when external diodes are required to transfer power dissipation from the A3977 package to the external diodes.

Timing Requirements

($T_A = +25^\circ\text{C}$, $V_{DD} = 5\text{ V}$, Logic Levels are V_{DD} and Ground)

- A. Minimum Command Active Time Before Step Pulse (Data Set-Up Time) 200 ns
- B. Minimum Command Active Time After Step Pulse (Data Hold Time)..... 200 ns
- C. Minimum STEP Pulse Width 1.0 μs
- D. Minimum STEP Low Time 1.0 μs
- E. Maximum Wake-Up Time 1.0 ms

Applications Information

Layout.

The printed wiring board should use a heavy ground plane.

For optimum electrical and thermal performance, the driver should be soldered directly onto the board.

The load supply terminal, V_{BB} , should be decoupled with an electrolytic capacitor (>47 μ F is recommended) placed as close to the device as possible.

To avoid problems due to capacitive coupling of the high dv/dt switching transients, route the bridge-output traces away from the sensitive logic-input traces. Always drive the logic inputs with a low source impedance to increase noise immunity.

Grounding. A star ground system located close to the driver is recommended.

The 44-lead PLCC has the analog ground and the power ground internally bonded to the power tabs of the package (leads 44, 1, 2, 11 – 13, 22 – 24, and 33 – 35).

On the 28-lead TSSOP package, the analog ground (lead 7) and the power ground (lead 21) must be connected together externally. The copper ground plane located under the exposed thermal pad is typically used as the star ground.

Current Sensing. To minimize inaccuracies caused by ground-trace IR drops in sensing the output current level, the current-sense resistor (R_S) should have an independent ground return to the star ground of the device. This path should be as short as possible. For low-value sense resistors the IR drops in the printed wiring board sense resistor's traces can be significant and should be taken into account. The use of sockets should be avoided as they can introduce variation in R_S due to their contact resistance.

Allegro MicroSystems recommends a value of R_S given by

$$R_S = 0.5/I_{TRIPmax}$$

Thermal Protection. Circuitry turns off all drivers when the junction temperature reaches 165°C, typically. It is intended only to protect the device from failures due to excessive junction temperatures and should not imply that output short circuits are permitted. Thermal shut-down has a hysteresis of approximately 15°C.

The products described here are manufactured under one or more U.S. patents or U.S. patents pending.

Allegro MicroSystems, Inc. reserves the right to make, from time to time, such departures from the detail specifications as may be required to permit improvements in the performance, reliability, or manufacturability of its products. Before placing an order, the user is cautioned to verify that the information being relied upon is current.

Allegro products are not authorized for use as critical components in life-support devices or systems without express written approval.

The information included herein is believed to be accurate and reliable. However, Allegro MicroSystems, Inc. assumes no responsibility for its use; nor for any infringement of patents or other rights of third parties which may result from its use.
