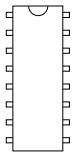
DABiC-5 8-Bit Serial Input Latched Sink Drivers

Package A
16-pin DIP



Package LW
16-pin Wide Body SOIC

ABSOLUTE MAXIMUM RATINGS

Output Voltage, V_{OUT} ..... **50 V**
Logic Supply Voltage, V_{DD} ..... **7 V**
Input Voltage Range, V_{IN} ..... **–0.3 V to V_{DD} +0.3 V**
Continuous Output Current (each output), I_{OUT} ... **500 mA**
Package Power Dissipation, P_D
A6821SA/A6821EA..... **2.1 W**
A6821SLW..... **1.5 W**
Operating Temperature Range
Ambient Temperature, T_A ..... **–20°C to +85°C**
Storage Temperature, T_S ..... **–55°C to +150°C**

Caution: CMOS devices have input-static protection, but are susceptible to damage when exposed to extremely high static-electrical charges.

A merged combination of bipolar and MOS technology gives these devices an interface flexibility beyond the reach of standard logic buffers and power driver arrays. Typical applications include driving multiplexed LED displays or incandescent lamps.

The A6821 has an eight-bit CMOS shift register and CMOS control circuitry, eight CMOS data latches, and eight bipolar current-sinking Darlington output drivers.

The CMOS inputs are compatible with standard CMOS logic levels. TTL circuits may require the use of appropriate pull-up resistors. By using the serial data output, the drivers can be cascaded for interface applications requiring additional drive lines.

The A6821SA is furnished in a standard 16-pin plastic DIP. The A6821EA is a 16-pin plastic DIP, capable of operation from -40°C to +85°C. The A6821SLW is a 16-lead wide-body SOIC, for surface-mount applications. These devices are lead (Pb) free, with 100% matte tin plated leadframes.

FEATURES

- 3.3 V to 5 V logic supply range
- Power on reset (POR)
- To 10 MHz data input rate
- CMOS, TTL compatible
- –40°C operation available
- Schmitt trigger inputs for improved noise immunity
- Low-power CMOS logic and latches
- High-voltage current-sink outputs
- Internal pull-up/pull down resistors

APPLICATIONS

- Multiplexed LED displays
- Incandescent lamps

Use the following complete part numbers when ordering:

Part Number	Package	Ambient
A6821SA-T	16-pin DIP	–20°C to +85°C
A6821EA-T	16-pin DIP	–40°C to +85°C
A6821SLW-T	16-pin wide body SOIC	–20°C to +85°C

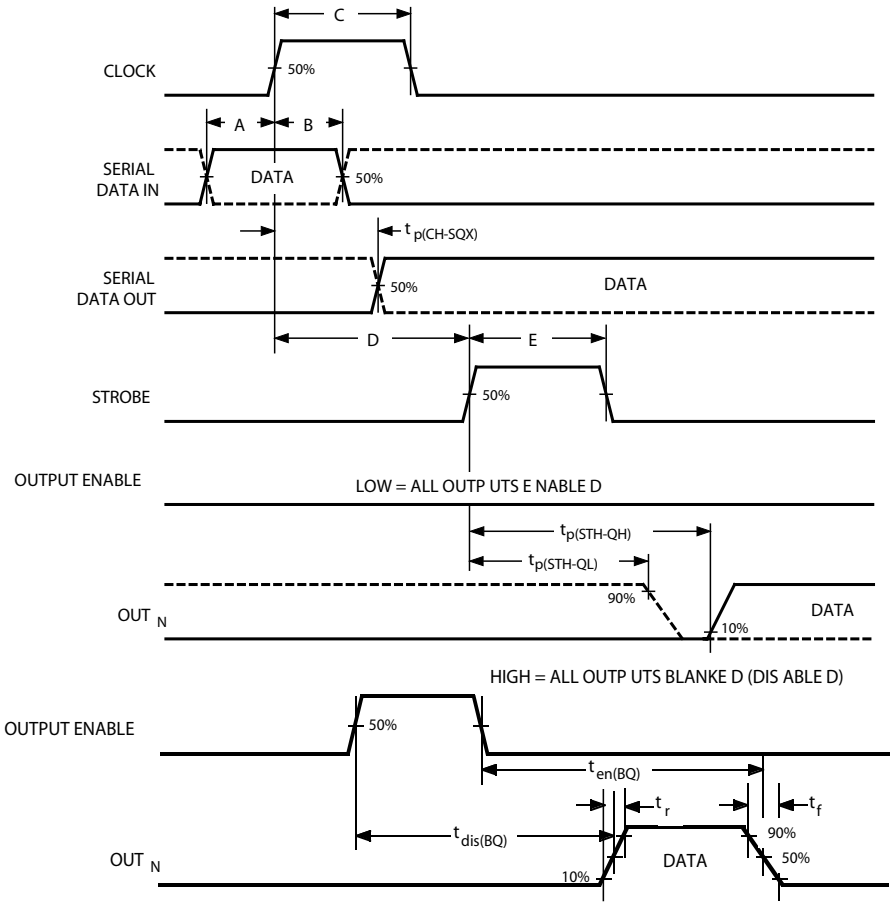
Timing Requirements and Specifications
(Logic Levels are V_{DD} and Ground)



Key	Description	Symbol	Time (ns)
A	Data Active Time Before Clock Pulse (Data Set-Up Time)	$t_{su(D)}$	25
B	Data Active Time After Clock Pulse (Data Hold Time)	$t_{h(D)}$	25
C	Clock Pulse Width	$t_{w(CH)}$	50
D	Time Between Clock Activation and Strobe	$t_{su(C)}$	100
E	Strobe Pulse Width	$t_{w(STH)}$	50

NOTE: Timing is representative of a 10 MHz clock. Higher speeds may be attainable; operation at high temperatures will reduce the specified maximum clock frequency.

Powering-on with the inputs in the low state ensures that the registers and latches power-on in the low state (POR).

Serial Data present at the input is transferred to the shift register on the logical 0 to logical 1 transition of the CLOCK input pulse. On succeeding CLOCK pulses, the registers shift data information towards the SERIAL DATA OUTPUT. The SERIAL DATA must appear at the input prior to the rising edge of the CLOCK input waveform.

Information present at any register is transferred to the respective latch when the STROBE is high (serial-to-parallel conversion). The latches will continue to accept new data as long as the STROBE is held high. Applications where the latches are bypassed (STROBE tied high) will require that the OUTPUT ENABLE input be high during serial data entry.

When the OUTPUT ENABLE input is high, all of the output buffers are disabled (OFF). The information stored in the latches or shift register is not affected by the OUTPUT ENABLE input. With the OUTPUT ENABLE input low, the outputs are controlled by the state of their respective latches.
