

# Agilent HCPL-3100/HCPL-3101 Power MOSFET/IGBT Gate Drive Optocouplers Data Sheet

## Description

The HCPL-3100/3101 consists of an LED\* optically coupled to an integrated circuit with a power output stage. These optocouplers are suited for driving power MOSFETs and IGBTs used in motor control inverter applications. The high operating voltage range of the output stage provides the voltage drives required by gate controlled devices. The voltage and current supplied by these optocouplers allow for direct interfacing to the power device without the need for an intermediate amplifier stage.

The HCPL-3100 switches a 3000 pF load in 2  $\mu$ s and the HCPL-3101, using a higher speed LED, switches a 3000 pF load in 0.5  $\mu$ s. With a CMR rating of 15 kV/ $\mu$ s typical these optocouplers readily reject transients found in inverter applications.

The LED controls the state of the output stage. Transistor Q2 in the output stage is on with the LED off, allowing the gate of the power device to be held low. Turning on the LED turns off transistor Q2 and switches on transistor Q1 in the output stage which provides current and voltage to drive the gate of the power device.

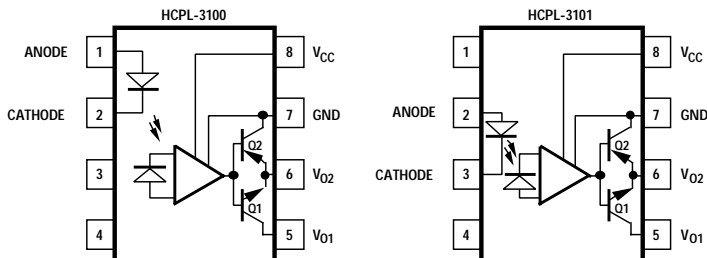

## Features

- High output current  
 $I_{O1}$  and  $I_{O2}$  (0.6 A Peak, 0.1 A continuous)
- 15 kV/ $\mu$ s minimum Common Mode Rejection (CMR) at  $V_{CM} = 1500$  V
- Wide operating  $V_{CC}$  range (15 to 30 volts)
- High speed  
1  $\mu$ s typical propagation delay (HCPL-3100)  
0.3  $\mu$ s typical propagation delay (HCPL-3101)
- Recognized under UL 1577 for dielectric withstand proof test voltages of 5000 vac, 1 minute

## Applications

- Isolated MOSFET/IGBT gate drive
- AC and DC motor drives
- General purpose industrial inverters
- Uninterruptable power supply

THE USE OF A 0.1  $\mu$ F BYPASS CAPACITOR CONNECTED BETWEEN PINS 6 AND 7 IS RECOMMENDED. ALSO CURRENT LIMITING RESISTOR IS RECOMMENDED (SEE FIGURE 1, AND NOTE 2 AND NOTE 7).

\*HCPL-3100 LED contains Silicon-doped GaAs and HCPL-3101 LED contains AlGaAs.

**CAUTION:** It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

## Outline Drawing

**Demonstrated ESD Performance**  
 Human Body Model: MIL-STD-883 Method 3015.7: Class 2  
 Machine Model: EIAJ IC-121-1988 (1988.3.28 Version 2),  
 Test Method 20, Condition C: 1200 V

**Regulatory Information**  
 The HCPL-3100/3101 has been approved by the following organization:

**UL**  
 Recognized under UL 1577, Component Recognition Program, File E55361.

**Insulation and Safety Related Specifications**

Parameter	Symbol	Value	Units	Conditions
Min. External Air Gap (External Clearance)	L(I01)	6.0	mm	Shortest distance measured through air, between two conductive leads, input to output
Min. External Tracking Path (External Creepage)	L(I02)	6.0	mm	Shortest distance path measured along outside surface of optocoupler body between input and output leads
Min. Internal Plastic Gap (Internal Clearance)		0.15	mm	Through insulation distance conductor to conductor inside the optocoupler cavity

### Recommended Protection for Output Transistors

During switching transitions, the output transistors Q1 and Q2 of the HCPL-3100/3101 can conduct large amounts of current. Figure 1 describes a recommended circuit design

showing a current limiting resistor  $R_2$  which is necessary in order to prevent damage to the output transistors Q1 and Q2. (See Note 7.) A bypass capacitor  $C_1$  is also recommended to reduce power supply noise.

\*The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to the IEC/EN/DIN EN 60747-5-2 Insulation Characteristics Table (if applicable), your equipment level safety specification, or Agilent Application Note 1074, "Optocoupler Input-Output Endurance Voltage."

#### Notes:

- Derate absolute maximum ratings with ambient temperatures as shown in Figures 11 and 12.
- A bypass capacitor of 0.01  $\mu\text{F}$  or more is needed near the device between  $V_{CC}$  and GND when measuring output and transfer characteristics.
- $I_{FLH}$  represents the forward current when the output goes from low to high.
- Device considered a two terminal device; pins 1-4 are shorted together and pins 5-8 are shorted together.
- For devices with minimum  $V_{ISO}$  specified at 5000 V rms, in accordance with UL 1577, each optocoupler is proof-tested by applying an insulation test voltage  $\geq 6000\text{ V rms}$  for one second (leakage current detection limit,  $I_{I-O} \leq 200\ \mu\text{A}$ ).
- The  $t_{PLH}$  and  $t_{PHL}$  propagation delays are measured from the 50% level of the input pulse to the 50% level of the output pulse.
- $R_2$  limits the Q1 and Q2 peak currents. For more applications and circuit design information see Application Note "Power Transistor Gate/Base Drive Optocouplers."
