

**Features**

- **ENHANCEMENTS**
  - ispLSI 2064A is Fully Form and Function Compatible to the ispLSI 2064, with Identical Timing Specifications and Packaging
  - ispLSI 2064A is Built on an Advanced 0.35 Micron E<sup>2</sup>CMOS<sup>®</sup> Technology
- **HIGH DENSITY PROGRAMMABLE LOGIC**
  - 2000 PLD Gates
  - 64 I/O Pins, Four Dedicated Inputs
  - 64 Registers
  - High Speed Global Interconnect
  - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
  - Small Logic Block Size for Random Logic
- **HIGH PERFORMANCE E<sup>2</sup>CMOS<sup>®</sup> TECHNOLOGY**
  - $f_{max} = 125$  MHz Maximum Operating Frequency
  - $t_{pd} = 7.5$  ns Propagation Delay
  - TTL Compatible Inputs and Outputs
  - Electrically Erasable and Reprogrammable
  - Non-Volatile
  - 100% Tested at Time of Manufacture
  - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
  - In-System Programmable (ISP<sup>™</sup>) 5V Only
  - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
  - Reprogram Soldered Devices for Faster Prototyping
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
  - Complete Programmable Device Can Combine Glue Logic and Structured Designs
  - Enhanced Pin Locking Capability
  - Three Dedicated Clock Input Pins
  - Synchronous and Asynchronous Clocks
  - Programmable Output Slew Rate Control to Minimize Switching Noise
  - Flexible Pin Placement
  - Optimized Global Routing Pool Provides Global Interconnectivity
  - Lead-Free Package Options

**Description**

The ispLSI 2064 and 2064A are High Density Programmable Logic Devices. The devices contain 64 Registers, 64 Universal I/O pins, four Dedicated Input pins, three Dedicated Clock Input pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The 2064 and 2064A feature 5V in-system programmability and in-system diagnostic capabilities. The ispLSI 2064 and 2064A offer non-volatile reprogrammability of the logic, as well as the interconnect, to provide truly reconfigurable systems.

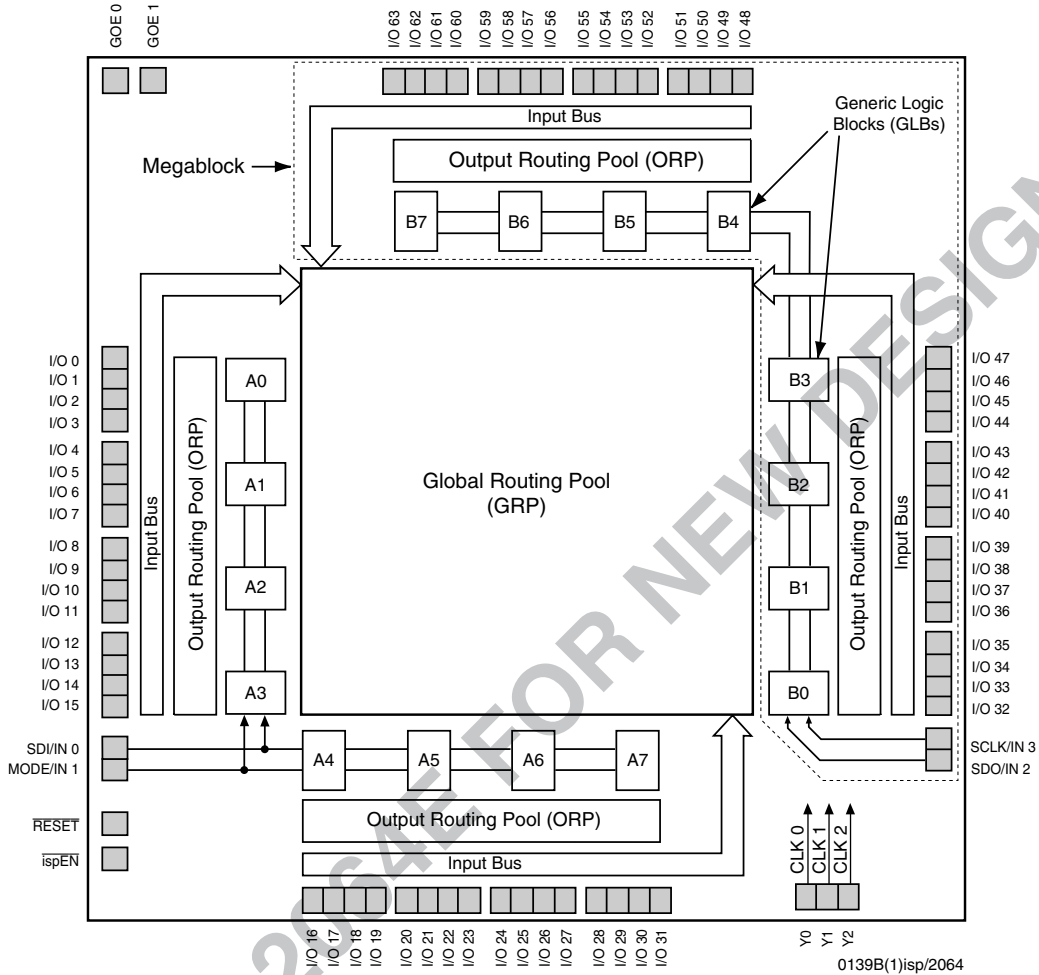

The basic unit of logic on these devices is the Generic Logic Block (GLB). The GLBs are labeled A0, A1...B7 (Figure 1). There are a total of 16 GLBs in the ispLSI 2064 and 2064A devices. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

**Functional Block Diagram**

**Figure 1. ispLSI 2064/A Functional Block Diagram**

The devices also have 64 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 32 I/O cells, two dedicated inputs and two ORPs are connected together to make a Megablock (Figure 1). The outputs of the eight GLBs are connected to a set of 32 universal I/O cells by two ORPs. Each ispLSI 2064 and 2064A device contains two Megablocks.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2064 and 2064A devices are selected using the dedicated clock pins. Three dedicated clock pins (Y0, Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

**Power Consumption**

Power consumption in the ispLSI 2064 and 2064A devices depends on two primary factors: the speed at which the device is operating and the number of Product Terms

used. Figure 4 shows the relationship between power and operating speed.

**Figure 4. Typical Device Power Consumption vs fmax**

Notes: Configuration of Four 16-bit Counters  
Typical Current at 5V, 25° C

ICC can be estimated for the ispLSI 2064/A using the following equation:

$$I_{CC}(mA) = 38 + (\# \text{ of PTs} * 0.33) + (\# \text{ of nets} * \text{Max freq} * 0.007)$$

Where:

- # of PTs = Number of Product Terms used in design
- # of nets = Number of Signals used in device
- Max freq = Highest Clock Frequency to the device (in MHz)

The ICC estimate is based on typical conditions (VCC = 5.0V, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.
