

**GENERAL DESCRIPTION**

The XRT59L921 is an optimized twenty-one channel, E1, line interface unit, fabricated using low power CMOS technology. The device contains twenty-one independent E1 channels. It is primarily targeted towards the SDH multiplexers that accommodate TU12 Tributary Unit Frames. Line cards in these units multiplex 21 E1 channels into higher SDH rates. Devices with 21 E1 interfaces such as the XRT59L921 provide the most efficient method of implementing 63-channel line cards. Each channel performs the driver and receiver functions necessary to convert bipolar signals to logical levels and vice versa.

The receiver input accepts transformer coupled 1:1 signals, while the transmitter is coupled to the line using a 1:2 transformer. The same transformer configuration can be used for both balanced and unbalanced interfaces. The device offers Loss of Signal (LOS) detection, that provides an LOS output indication signal with thresholds and delay that comply with the ITU G.775 requirements.

**FEATURES**

- Twenty-One (21) Independent E1 (CEPT) Line Interface Units (Transmitter, Receiver, and Recovery)
- Transmit Output Pulses that are Compliant with the ITU-T G.703 Pulse Template Requirement for 2.048Mbps (E1) Rates
- On-Chip Pulse Shaping for both 75Ω and 120Ω line drivers
- Detects and Clears LOS (Loss of Signal) Per ITU-T G.775
- Operates over the Industrial Temperature Range
- Ultra Low power consumption
- 3.3V operation with 5V Tolerant Input

**APPLICATIONS**

- PDH Multiplexers
- SDH Multiplexers
- Digital Cross-Connect Systems
- DECT (Digital European Cordless Telephone) Base Stations
- CSU/DSU Equipment

Supply Voltage	-0.5V to + 6.0V	

**SYSTEM DESCRIPTION**

The XRT59L921 is a Twenty-One (21) channel E1 transceiver that provides an electrical interface for 2.048Mbps applications. Each of the twenty-one channels includes a receive circuit that converts an ITU-T G.703 compliant bipolar signal into a TTL compatible logic levels. Each receiver also includes an LOS (Loss of Signal) detection circuit. Similarly, in the Transmit Direction, each Transmitter converts TTL compatible logic levels into a G.703 compatible bipolar signal. The Transmitter may be operated in either a Clock or Clockless Mode.

Each channel within the XRT59L921 LIU consists of both a Transmit Section and a Receive Section, each of these sections will be discussed in detail below.

**1.0 THE TRANSMIT SECTION**

In general, the purpose of the Transmit Section (within each channel of the XRT59L921) is to accept TTL/CMOS level digital data (from the Terminal Equipment), and to encode it into a format such that it can:

1. Be efficiently transmitted over coaxial- or twistedpair cable at the E1 data rate and
2. Be reliably received by the Remote Terminal Equipment at the other end of the E1 data link.
3. Comply with the ITU-T G.703 pulse template requirements, for E1 applications.

The circuitry that the Transmit Section (within the XRT59L921) uses to accomplish this goal is discussed below. The Transmit Section of the XRT59L921 consists of the following blocks:

- Transmit Input Interface
- Pulse Shaping Block

**1.1 The Transmit Input Interface**

The Transmit Input Interface accepts either Clock or clockless data from the Terminal Equipment. The manner in how the Terminal Equipment should apply data to a given channel within the XRT59L921 depends upon whether the channel is being operated in the Clock or clockless mode.

**1.2 Operating the Transmitter in the Clock Mode**

The user can configure a given channel (within the XRT59L921) to operate in the Clock mode by simply applying a 2.048MHz clock signal to the TxClk\_n input pin (where x denotes a given channel within the XRT59L921). The XRT59L921 contains circuitry that senses activity on the TxClk\_n line. If this circuit senses activity on the TxClk\_n line, then the corresponding channel will automatically be operating in the Clock Mode.

In the Clock Mode, the Terminal Equipment is expected to apply a 2.048MHz clock signal at the TxClk\_n input pin and NRZ data at the TxPOS\_n and TxNEG\_n input pins. The Transmit Input Interface circuit will sample the data, at the TxPOS\_n and TxNEG\_n input pins, upon the falling edge of TxClk\_n, as illustrated in **Figure 4**.

FIGURE 4. ILLUSTRATION ON HOW THE XRT59L921 SAMPLES THE DATA ON THE TxPOS\_n AND TxNEG\_n INPUT PINS

In general, if the XRT59L921 samples a “1” on the TxPOS\_n input pin, then the Transmit Section of the device will ultimately generate a positive polarity pulse via the TTIP\_n and TRing\_n output pins (across a 1:2 transformer). Conversely, if the XRT59L921 samples a “1” on the TxNEG\_n input pin, then the Transmit Section of the device will ultimately generate a negative polarity pulse via the TTIP\_n and TRing\_n output pins (across a 1:2 transformer).

### 1.2.1 Operating the Transmitter in the Clockless Mode

The user can configure a given channel (within the XRT59L921) to operate in the Clockless mode by doing the following:

- Not applying a clock signal to the TxClk\_n input, and pulling this pin to VDD.
- By applying RZ (Return to Zero) data to the TxPOS\_n and TxNEG\_n input pins, as illustrated below.
- If TxClk\_n is grounded and RZ data is applied to TPOS and TNEG, the transmitter will be powered down and tri-stated.

### 1.2.2 Shutting off the Transmitter

The Transmit Driver for each Channel\_n (within the XRT59L921) can be shut off. To activate this feature, Connect the TxCLK\_n input pin to a logic “0” (e.g. GND) and continue to apply data via the TxPOS\_n and TxNEG\_n input pins.

**FIGURE 5. ILLUSTRATION ON HOW THE TERMINAL EQUIPMENT SHOULD APPLY DATA TO THE TRANSMIT SECTION OF A GIVEN CHANNEL (WITHIN THE XRT59L921), WHEN OPERATING IN THE CLOCKLESS MODE**

Figure 5, indicates that when the user is operating a channel in the Clockless Mode, then the corresponding Terminal Equipment must do the following:

- Not apply a signal on the TxClk\_n line and connect TxClk to "High"
- When applying a pulse (to either the TxPOS\_n or TxNEG\_n input pin), apply an RZ pulse to the appropriate input pin. This RZ pulse should only have a width of one-half the bit-period.

**1.3 The Pulse Shaping Circuit**

The purpose of the Transmit Pulse Shaping circuit is to generate Transmit Output pulses that comply with the ITU-T G.703 Pulse Template Requirements for E1 Applications.

FIGURE 6. ILLUSTRATION OF THE ITU-T G.703 PULSE TEMPLATE FOR E1 APPLICATIONS

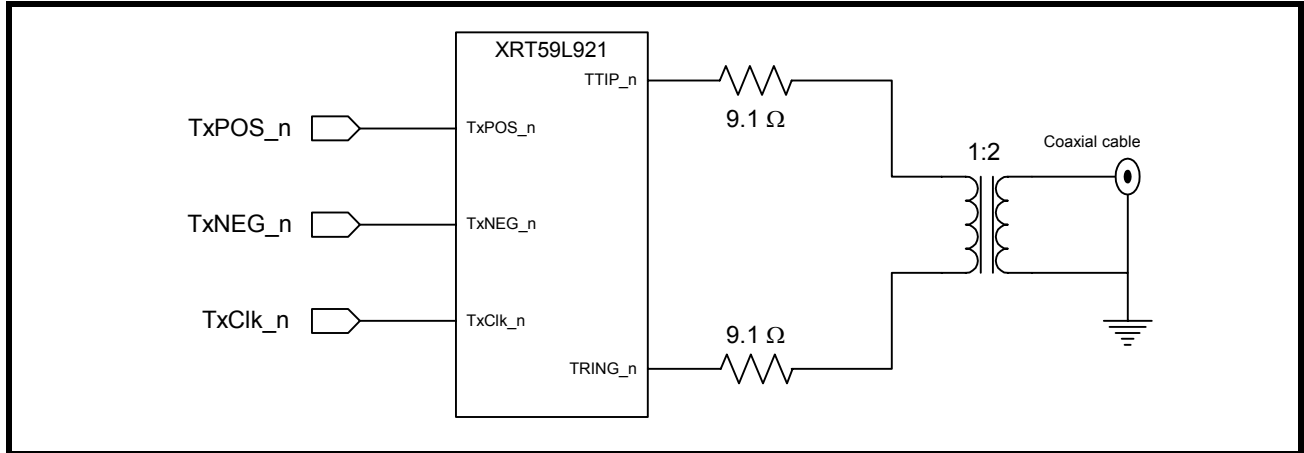

Each channel (within the XRT59L921) will take each mark (which is provided to it via the Transmit Input Interface block, and will generate a pulse that complies with the pulse template, presented in [Figure 6](#), (when measured on the secondary-side of the Transmit Output Transformer).

#### 1.4 Interfacing the Transmit Sections of the XRT59L921 to the Line

ITU-T G.703 specifies that the E1 line signal can be transmitted over coaxial cable and terminated with 75Ω or transmitted over twisted-pair and terminated with 120Ω. However, in both applications (e.g., 75Ω or 120Ω), the user is advised to interface the Transmitter to the Line, in the manner as depicted in [Figure 7](#) and [Figure 8](#), respectively.

**FIGURE 7. ILLUSTRATION OF HOW TO INTERFACE THE TRANSMIT SECTIONS OF THE XRT59L921 TO THE LINE (FOR 75Ω APPLICATIONS)**

**FIGURE 8. ILLUSTRATION OF HOW TO INTERFACE THE TRANSMIT SECTIONS THE XRT59L921 TO THE LINE (FOR 120Ω APPLICATIONS)**

**NOTES:**

1. **Figure 7** and **Figure 8**, indicate that for both 75Ω and 120Ω applications, the user should connect a 9.1Ω resistor, in series, between the TTIP/TRing outputs and the transformers.
2. **Figure 5** and **6**, indicate that the user should use a 1:2 STEP-UP Transformer.

**TRANSMIT TRANSFORMER RECOMMENDATIONS**

PARAMETER	VALUE
Turns Ratio	1:2

**2.0 THE RECEIVE SECTION**

The Receive Sections of the XRT59L921 consists of the following blocks:

- The Receive Equalizer block
- The Peak Detector and Slicer block
- The LOS Detector block
- The Receive Output Interface block

**2.1 Interfacing the Receive Sections to the Line (Transformer Coupling)**

The design of each channel (within the XRT59L921) permits the user to transformer-couple the Receive Section to the line. Additionally, as mentioned earlier, the specification documents for E1 specify 75Ω termination loads, when transmitting over coaxial cable, and 120Ω loads, when transmitting over twisted-pair. **Figure 9**, and **Figure 10** present the two methods that the user can employ in order to interface the Receivers (of the XRT59L921) to the line.

**FIGURE 9. RECOMMENDED SCHEMATIC FOR INTERFACING THE RECEIVE SECTIONS OF THE XRT59L921 TO THE LINE FOR 75Ω APPLICATIONS (TRANSFORMER-COUPLING)**

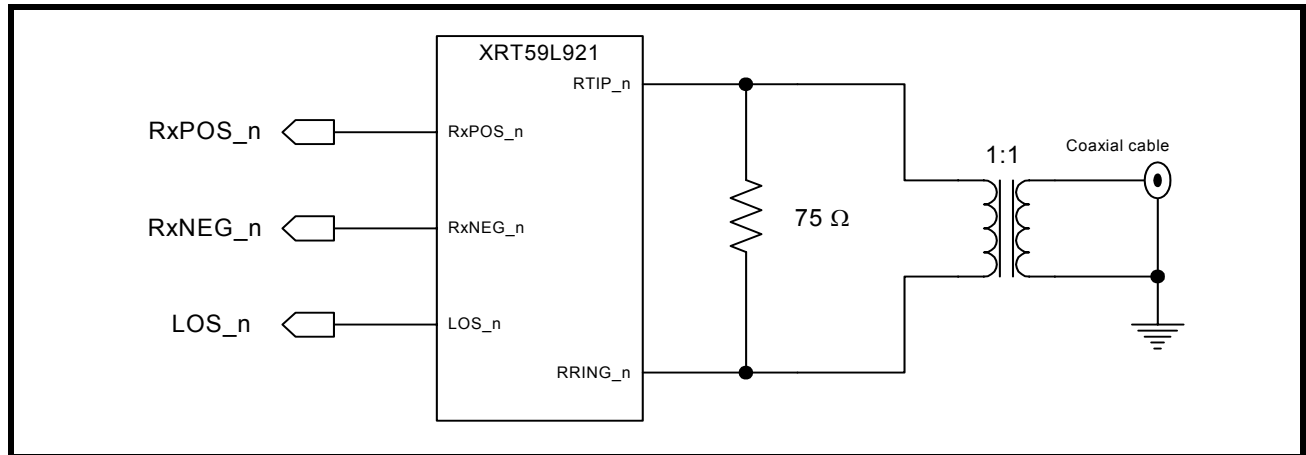

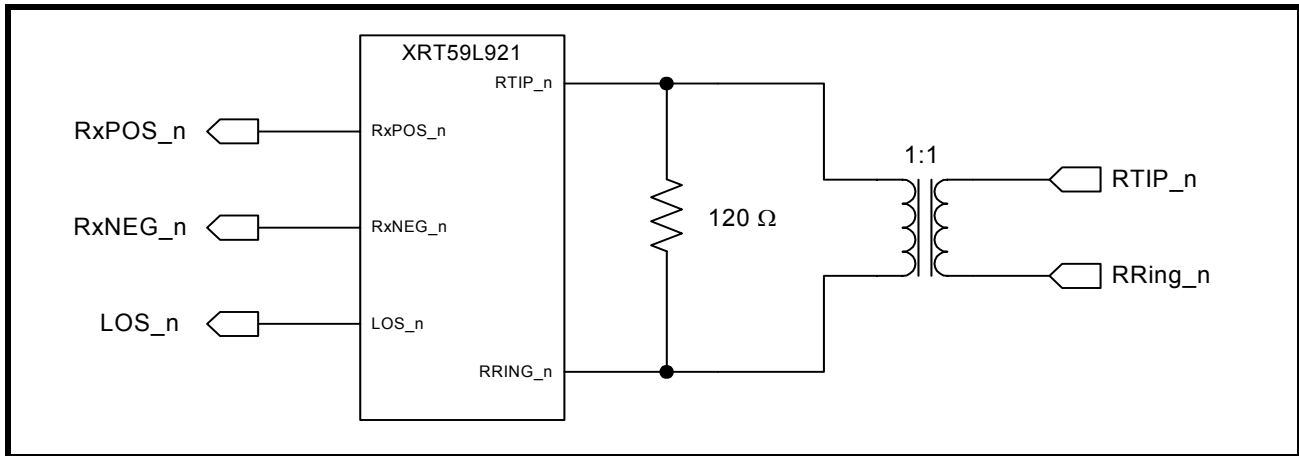

FIGURE 10. RECOMMENDED SCHEMATIC FOR INTERFACING THE RECEIVE SECTIONS OF THE XRT59L921 TO THE LINE FOR 120Ω APPLICATIONS (TRANSFORMER-COUPLING)

**NOTE:** Figure 9 and Figure 10 indicate that the user should use a 1:1 transformer, when interfacing the receiver to the line.

**TRANSFORMER RECOMENDATION**

Primary Inductance	
Isolation Voltage	
Leakage Inductance	

**2.2 Interfacing the XRT59L921 Receive Section to the Line (Capacitive Coupling)**

Figure 11 and Figure 12 are recommended methods to Interface the the receive sections of the XRT59L921to the line.

**FIGURE 11. RECOMMENDED 75Ω CAPACITIVE COUPLING APPLICATION**

**FIGURE 12. RECOMMENDED 120Ω TWISTED PAIR CAPACITIVE COUPLING APPLICATION**

**2.3 The Receive Equalizer Block**

After a given Channel (within the XRT59L921) has received the incoming line signal, via the RTIP\_n and RRing\_n input pins, the first block that this signal will pass through is the Receive Equalizer block.

As the line signal is transmitted from a given Transmitting terminal, the pulse shapes (at that location) are basically square. Hence, these pulses consist of a combination of low and high frequency Fourier components. As this line signal travels from the transmitting terminal (via the coaxial cable or twisted pair) to the receiving terminal, it will be subjected to frequency-dependent loss. In other words, the higher frequency components of the signal will be subjected to a greater amount of attenuation than the lower frequency components. If this line signal travels over reasonably long cable lengths, then the shape of the pulses (which were originally square) will be distorted and with inter-symbol interference increases.

The purpose of this block is to equalize the incoming distorted signal, due to cable loss. In essence, the Receive Equalizer block accomplishes this by subjecting the received line signal to frequency-dependent amplification (which attempts to counter the frequency-dependent loss that the line signal has experienced). By doing this, the Receive Equalizer is attempting to restore the shape of the line signal so that the received data can be recovered reliably.

**2.4 The Peak Detector and Slicer Block**

After the incoming line signal has passed through the Receive Equalizer block, it will next be routed to the Slicer block. The purpose of the Slicer block is to quantify a given bit-period (or symbol) within the incoming line signal as either a “1” or a “0”.

**2.5 The LOS Detector block**

The LOS Detector block, within each channel (of the XRT59L921) was specifically designed to comply with the LOS Declaration/Clearance requirements per ITU-T G.775. As a consequence, the channel will declare a LOS Condition, (by driving the RxLOS output pin “High”) if the received line signal amplitude drops to -20dB or below. Further, the channel will clear the LOS Condition if the signal amplitude rises back up to -15dB or above. **Figure 13** presents an illustration that depicts the signal levels at which a given channel (within the XRT59L921) will assert and clear LOS.

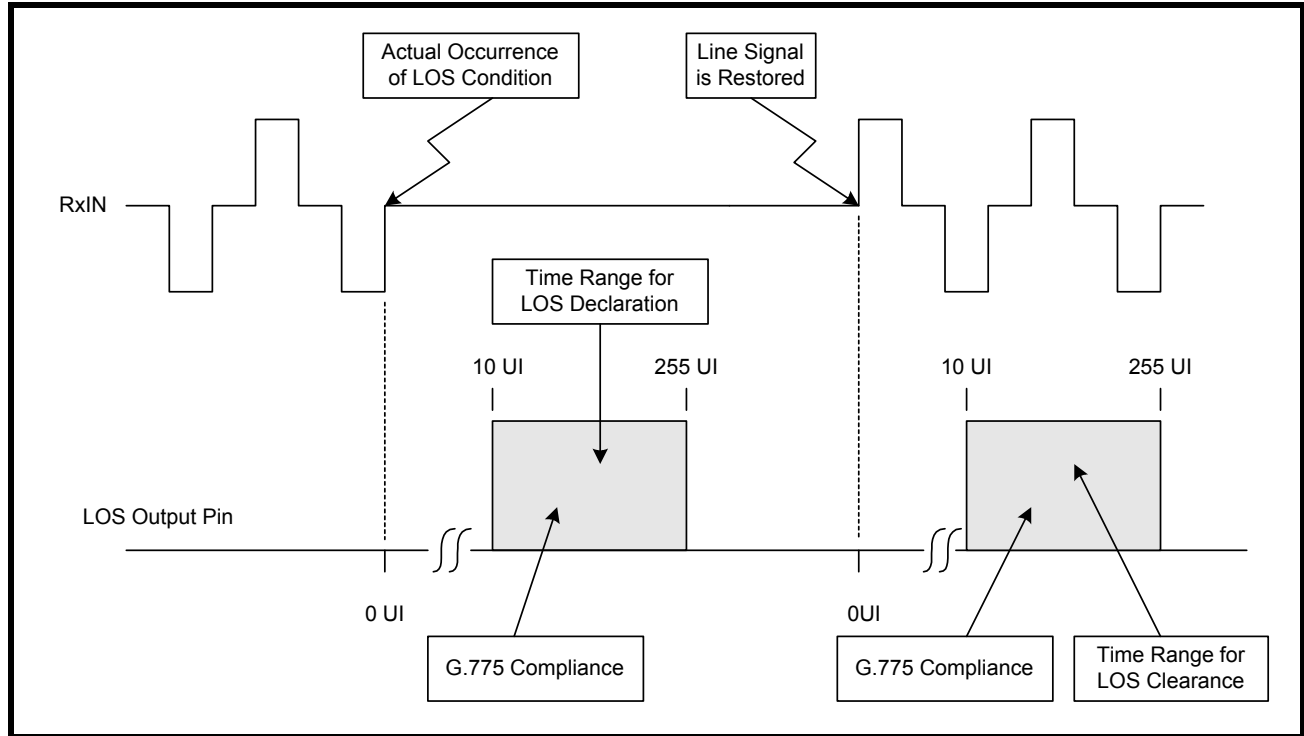

**FIGURE 13. ILLUSTRATION OF THE SIGNAL LEVELS THAT THE RECEIVER SECTIONS (WITHIN XRT59L921) WILL DECLARE AND CLEAR LOS**

Timing Requirements associated with Declaring and Clearing the LOS Indicator. The XRT59L921 was designed to meet the ITU-T G.775 specification timing requirements for declaring and clearing the LOS

indicator. In particular, the XRT59L921 will declare a LOS, between 10 and 255 UI (or E1 bit-periods) after the actual time the LOS condition occurred. Further, the XRT59L921 will clear the LOS indicator within 10 to 255 UI after restoration of the incoming line signal. **Figure 14** illustrates the LOS Declaration and Clearance behavior, in response to first, the Loss of Signal event and then afterwards, the restoration of the signal.

**FIGURE 14. THE BEHAVIOR OF THE LOS OUTPUT INDICATOR, IN RESPONSE TO THE LOSS OF SIGNAL, AND THE RESTORATION OF THE SIGNAL**

**2.6 LOS Mute Description**

The LOSMute feature is included in the XRT59L921 such that when the input signal to a receiver is too low or is lost. The LOS\_n pin will toggle "High" and at the same time the RPOS\_n and RNEG\_n outputs are muted to a "Zero" state to prevent output data chattering.

**2.7 The Receive Output Interface block**

The purpose of the Receive Output Interface block is to interface directly with the Receiving Terminal Equipment. The Receive Output Interface block outputs the data (which has been recovered from the incoming line signal) to the Receive Terminal Equipment via the RxPOS\_n and RxNEG\_n output pins.

If the Receive Sections of the XRT59L921 has received a Positive-Polarity pulse, via the RTIP\_n and RRing\_n input pins, then the Receive Output Interface will output a pulse via the RxPOS\_n output pins.

Similarly, if the Receive Sections of the XRT59L921 has received a Negative-Polarity pulse, via the RTIP\_n and RRing\_n input pins, then the Receive Output Interface will output a pulse via the RxNEG\_n output pins.

*NOTE: The Receive Output Interface block does not supply a recovered clock. This device is intended to be used in those applications, where the Clock Recovery circuit is realized in an ASIC solution.*

**3.0 SHUTTING OFF THE TRANSMITTER**

Each channel (within the XRT59L921) permits the user to shut off the Transmit Driver within their respective Transmit Section. This feature can come in handy for system redundancy design considerations or during diagnostic testing. The user can activate this feature by connecting the TxClk\_n input pin to a logic "0" (e.g., GND) and continue to apply data via the TxPOS\_n and TxNEG\_n input pins.

FIGURE 16. RECEIVE TIMING DIAGRAM

**APPLICATION INFORMATION**

Figure 17 and Figure 18, provide example schematics on how to interface Channel 1 of the XRT59L921 to the line, under the following conditions.

- Receiver is Transformer-coupled to a 75Ω unbalanced line.
- Receiver is Transformer-coupled to a 120Ω balanced line.

**FIGURE 17. ILLUSTRATION ON HOW TO INTERFACE CHANNEL 1 (OF THE XRT59L921) TO THE LINE (RECEIVER IS TRANSFORMER-COUPLED TO A 75Ω UNBALANCED LINE)**

**TWENTY-ONE CHANNEL E1 LINE INTERFACE UNIT****REVISION HISTORY**

REVISION #	DATE	DESCRIPTION
P1.0.0	09/01/04	1st release of the XRT59L921 preliminary data sheet.
P1.0.1	10/28/04	CCorrected receive transformer turns ratio from 1:2 to 1:1. Added package outline drawing and pin numbers. Other minor edits
1.0.0	06/23/05	Replaced power supply current TBD's with actual. Release to production
1.1.0	09/07/05	Added comment to TxCLK pin description, added note to TxNEG pin description[, deleted "with -18db-----" comment from electrical receiver sensitivity, minor edit to sect.1.2 and added sect. 1.2.2.
1.2.0	03/07/07	Added A2O, Y2, Y20 pins to positive supply. Added pins F1, F20, J1, J20, M1, M20, R1, R20 to digital ground. Added pins H16, P5, P16, P17 to AGND description. Added pin D15 to NC
1.2.1	03/12/07	Added pin V1 DGND in pin list.
