## ZLED7730

High Current 40V LED Driver with Switch Dimming

## Brief Description

The ZLED7x30 continuous-mode inductive stepdown converter family is one of our ZLED LEDcontrol ICs. It is designed for applications requiring high brightness and high current. The ZLED7x30 can efficiently drive a single LED or multiple series-connected LEDs from a voltage input higher than the LED forward voltage (Vin $=8.5$ to $40 \mathrm{VDC})$. It provides an adjustable output current (1.2A maximum), which is set via an external resistor and controlled by the ZLED7x30's integrated high-side output current-sensing circuit and high speed internal 40 V power switch. Its low conducting impedance ensures high system efficiency.
The ZLED7x30 provides a switch dimming function. It detects external switch action to adjust output current, allowing dimming functionality to be achieved without changing the original lighting system circuitry.
The switch dimming is implemented in either twolevel mode or three-level mode. The output current of every level and the total number of levels are customer selected by setting the corresponding input conditions of DIM1 and DIM2 pin.
The ZLED7x30 enables diverse industrial and consumer lighting applications requiring high driving currents, wide operating voltage range, high efficiency, and variable brightness control. It offers over-temperature and LED open-circuit protection. The ZLED7x30 can also minimize bill-of-material costs because very few external components are required for most applications. Only a resistor, a diode, an inductor, and three capacitors are needed for a typical basic application.

Features

- Switch dimming with multiple levels
- Three modes for output level settings
- Up to 0.35A output current
- Internal 40V power switch
- Wide DC input voltage range 8.5 to 40 VDC
- Output current accuracy: 5\% (typical)
- LED open-circuit protection
- Thermal shutdown protection

## Benefits

- High efficiency: up to $98 \%$
- Very few external components needed for operation
- Adds switch dimming function to existing installation

## Available Support

- Evaluation Kit

## Physical Characteristics

- Operating temperature: $-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$
- Switching frequency: up to 1 MHz
- SOP-8 package

| ZLED7x30 Family Selection Matrix |  |  |
| :---: | :---: | :---: |
| Product | Max. Current Output | Package |
| ZLED7030 | 1.2 A | SOP-8 |
| ZLED7330 | 1.0 A | SOP-8 |
| ZLED7530 | 0.75 A | SOP-8 |
| ZLED7730 | 0.35 A | SOP-8 |

ZLED7x30 Typical Application Circuit

## ZLED7x30 Block Diagram

## Typical Applications

* Illuminated LED signs and other displays
* LED street and traffic lighting (low voltage)
* Architecture/building LED lighting
* LED backlighting
* Interior/exterior LED lighting
* MR16 LED spot lights
* Retrofit LED lighting fixtures
* General purpose industrial and consumer LED applications

## Ordering Information

## 1 IC Characteristics

Note: Exceeding the maximum ratings given in this section could cause operation failure and/or cause permanent damage to the ZLED7x30. Exposure to these conditions for extended periods may affect device reliability.

### 1.1 Absolute Maximum Ratings

| No. | PARAMETER | SYMBOL | CONDITIONS | MIN | TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1.1.1 | Input voltage (also see specification 1.2.2) | $\mathrm{V}_{\mathrm{IN}}$ |  | -0.3 |  | 50 | V |
| 1.1.2 | ISENSE pin voltage | $V_{\text {ISENSE }}$ | $\mathrm{V}_{1 \mathrm{~N}} \geq 5 \mathrm{~V}$ | $\mathrm{V}_{\text {IN-5 }}$ 5V |  | $\mathrm{V}_{\text {IN }}+0.3 \mathrm{~V}$ | V |
|  |  |  | $\mathrm{V}_{\text {IN }}<5 \mathrm{~V}$ | -0.3V |  | $\mathrm{V}_{\mathrm{IN}+0.3 \mathrm{~V}}$ | V |
| 1.1.3 | LX pin output voltage | VLX |  | -0.3 |  | 50 | V |
| 1.1.4 | DIM1, DIM2 pin input voltage | $V_{\text {DIM }}$ |  | -0.3 |  | 6 | V |
| 1.1.5 | LX pin switch output current | ILX |  |  |  | 1.5 | A |
| 1.1.6 | Power dissipation | $\mathrm{P}_{\text {tot }}$ |  |  |  | 0.5 | W |

## 2 Circuit Description

### 2.1 ZLED7x30 Overview

The ZLED7x30 is a continuous-mode inductive step-down converter LED driver for driving single or multiple series-connected LEDs from a voltage input higher than the LED voltage (Vin = 8.5 to 40VDC; see section 3.2.2 for important details). The ZLED7x30 provides an adjustable output current (1.2A maximum for ZLED7030; 1.0A maximum for ZLED7330; 0.75A maximum for ZLED7530; 0.35A maximum for ZLED7730), which is nominally set via an external sense resistor Rs and controlled by the ZLED7x30's integrated high-side output current-sensing circuit and output switch. The ZLED7x30 detects external switching action on the supply line to adjust the output current in different modes on different levels.
Only a resistor, a diode, an inductor, and three capacitors are needed for a typical basic application. Refer to the application circuits in section 3 for the location of the components referred to in the following sections.

### 2.2 Control of Output Current via External Sense Resistor Rs

External sense resistor Rs, which is connected between the $\mathrm{V}_{\mathbb{I N}}$ and $I_{\text {SENSE }}$ pins as shown in Figure 3.1 , sets $l_{\text {Outnom, }}$ the nominal average output current. Equation (1) can be used to calculate the nominal output current, which is the LX switch output current $I_{L X}$ if no switch dimming condition is valid. See section 3.3.1 for recommended values for Rs in a typical basic application and section 3.4 for layout guidelines for Rs.

$$
\begin{equation*}
I_{\text {OUTnom }}=\frac{0.1 V}{R s} \tag{1}
\end{equation*}
$$

### 2.3 Multi-Mode Switch Dimming

The ZLED7x30 detects external switching action on the supply line to adjust output current, allowing dimming functionality to be achieved without changing the original lighting system circuitry. The switch dimming is implemented in either two-level mode or three-level mode. The output current of each level and the total number of levels are customer selected by setting the corresponding input conditions on the DIM1 and DIM2 pins. See page 2 for a typical application using the DIM1 and DIM2 pins.
The output current is set at the initial $100 \%$ value determined by the sense resistor Rs the first time that power is supplied to the chip. After the initial power up sequence, the chip adjusts the output current according to the external switch action. After the lowest current level, the current cycles back to the initial value if subsequent switch action is detected. If the power is switched off for longer than 2 seconds, the device will return to its initial state and the output current will be set to the initial value the next time that power is applied.
There are two types of switch action: a normal switch, which has an off-time between each subsequent switch action longer than 2 s , and a dimming switch, which has an off-time between each subsequent switch less than 2 s .
The dimmed average output current is given by

$$
\begin{equation*}
I_{\text {OUT dim }}=K_{X} * \frac{0 . I V}{R s} \tag{2}
\end{equation*}
$$

## Where

$K_{X}=$ Current ratio to initial current (see section 1.3).

The input conditions on the DIM1 and DIM2 pins set the number of current levels and the current ratio relative to the initial average current for the dimming switch (DS) sequences as shown in Table 2.1.

Table 2.1 Dimming Configuration Options

| Dimming Mode | DIM1 | DIM2 | Dimming Ratio K |
| :---: | :--- | :--- | :--- |
| No dimming | Floating | Floating | $(100 \%)$ |
| 1 | Floating | GND | $\mathbf{1 0 0 \%} \rightarrow 1^{\text {st }}$ DS $\rightarrow \mathbf{5 0 \%} \rightarrow 2^{\text {nd }}$ DS $\rightarrow \mathbf{2 0 \%} \rightarrow 3^{\text {rd }}$ DS $\rightarrow \mathbf{1 0 0 \%} \ldots$ |
| 2 | GND | Floating | $\mathbf{1 0 0 \%} \rightarrow 1^{\text {st }} \mathrm{DS} \rightarrow \mathbf{6 0 \%} \rightarrow 2^{\text {nd }}$ DS $\rightarrow \mathbf{3 0 \%} \rightarrow 3^{\text {rd }}$ DS $\rightarrow \mathbf{1 0 0 \%} \ldots$ |
| 3 | GND | GND | $\mathbf{1 0 0 \%} \rightarrow 1^{\text {st }} \mathrm{DS} \rightarrow \mathbf{3 0 \%} \rightarrow 2^{\text {nd }}$ DS $\rightarrow \mathbf{1 0 0 \%} \ldots$ |

If a normal switch is detected or if DIM1 and DIM2 are both floating, the output current goes back to the initial state of $100 \%$ nominal average output current. Since ZLED7x30 needs to count the time for more than 2 seconds after the switch is off during a normal switch, one capacitor (C1) equal to or greater than $220 \mu \mathrm{~F}$ is required to keep the chip working in low quiescent current mode during this part of the off-time.

### 2.4 ZLED7x30 Protection Features

### 2.4.1 Thermal Shut-down Protection

The ZLED7x30 automatically protects itself from damage due to over-temperature conditions. If the ZLED7x30's temperature exceeds the thermal shutdown threshold ( $T_{S D}=150^{\circ} \mathrm{C}$, typical), the ZLED7x30 will shutdown. To avoid erratic ZLED7x30 operation, a 20 K hysteresis ( $\mathrm{T}_{\mathrm{SD}-\mathrm{HYS}}$ ) is applied that prevents it from returning to operation until its temperature falls below the hysteresis threshold ( $\mathrm{T}_{\text {SD }}-\mathrm{T}_{\text {SD-HYS }}$ ). Also refer to section 3.2 for additional thermal considerations.

### 2.4.2 LED Open-Load Protection

As a step-down converter, the ZLED7x30 has inherent open-load circuit protection. Since the L1 inductor is connected in series with the LED string, the current flow is interrupted if the load is open and the LX output of the ZLED7x30 will not be damaged. This provides an advantage over other products such as boost converters, for which the internal switch can be damaged by back EMF forcing the drain above its breakdown voltage.

August 16, 201

## 3 Application Circuit Design

### 3.1 Applications

The ZLED7x30 is designed for applications requiring features such as high-speed switching, variable brightness control, operation with voltages up to 40 V , high efficiency, or protection from over-temperature, or open LED circuit conditions.
Typical applications include MR16/MR11 LED spot lights, LED street lights, parabolic aluminized reflector (PAR) LED lights, and other general purpose industrial and consumer LED applications.
Figure 3.1 shows the minimum configuration for switch dimming applications. Figure 3.2 demonstrates the basic application circuit with the additional capacitors C 1 and C 3 for enhanced performance. For dimensioning of the current sense resistor, see section 2. An example of operation with a halogen lamp electronic transformer is shown in Figure 3.3.

Figure 3.1 ZLED7x30 Application Circuit for Switch Dimming

Figure 3.2 Basic ZLED7x30 Application Circuit with Output Current Determined only by Rs

Figure 3.3 ZLED7x30 Application Circuit using a Halogen Electronic Transformer to Operate with AC Line Supply

### 3.2 Thermal Considerations for Application Design

### 3.2.1 Temperature Effects of Load, Layout, and Component Selection

Do not exceed the package power dissipation limits by driving high load currents or by operating the chip at high ambient temperatures. Power dissipation also increases if the efficiency of the circuit is low as could result from selecting the wrong coil or from excessive parasitic output capacitance on the switch output. See the layout guidelines in section 3.4.

### 3.2.2 Temperature Effects of Low Supply Voltage $\mathrm{V}_{\mathrm{IN}}$

Until the supply input voltage on the $\mathrm{V}_{\mathrm{IN}}$ pin has risen above the internally-set startup threshold, the ZLED7x30's internal regulator disables the drive to the internal power MOSFET output switch. Above this threshold, the MOSFET on-resistance is low enough for the chip to start to operate; however, if the supply voltage remains below the specified minimum ( 8.5 V ), the duty cycle of the output switch will be high and the ZLED7x30 power dissipation will be at a maximum. Avoid operating the ZLED7x30 under such conditions to reduce the risk of damage due to exceeding the maximum die temperature. When driving multiple LEDs, their combined forward voltage drop is typically high enough to prevent the chip from switching when $\mathrm{V}_{\mathrm{IN}}$ is below 8.5 V , so there is less risk of thermal damage.

### 3.3 External Component Selection

Note: Also see section 3.4 for layout guidelines for the following external components.

### 3.3.1 Sense Resistor Rs

Table 3.1 gives values for Rs under normal operating conditions in the typical application shown in Figure 3.1. These values assume that no dimming condition is valid. Under the conditions given the table, in order to maintain the switch current below the maximum value specified in section $1,0.082 \Omega$ is the minimum value for Rs for the ZLED7030, $0.1 \Omega$ for the ZLED7330, $0.13 \Omega$ for the ZLED7530 and $0.27 \Omega$ for the ZLED7730.

The information furnished in this publication is subject to changes without notice. | 16 of 23 |
| :--- | :--- | :--- | :---: |

To ensure stable output current, use a $1 \%$ accuracy resistor with adequate power tolerance and a good temperature characteristic for Rs.
Table 3.1 Recommended Values for Sense Resistor Rs

| Nominal Average Output Current (mA) | Value for $\mathbf{R}_{\mathbf{S}}(\Omega)$ |
| :---: | :---: |
| 1200 (maximum for ZLED7030) | 0.082 |
| 1000 (maximum for ZLED7330) | 0.1 |
| 750 (maximum for ZLED7530) | 0.13 |
| 667 | 0.15 |
| 350 (maximum for ZLED7730) | 0.27 |
| 333 | 0.3 |

### 3.3.2 Inductor L1

The recommended range for the L 1 inductor is $33 \mu \mathrm{H}$ to $220 \mu \mathrm{H}$. Select the inductor value for L 1 as needed to ensure that switch on/off times are optimized across the load current and supply voltage ranges. If the application requires a high supply voltage and low output current, inductance values at the high end of this range are recommended to minimize errors due to switching delays, which can reduce efficiency and increase ripple on the output. Also see section 3.4 for layout considerations for L1. Equations (3) and (4) can be used to calculate ton and toff.

On Time for LX Switch (toNmin $>200 \mathrm{~ns}$ ):

$$
\begin{equation*}
t_{O N}=\frac{L^{*} \Delta I}{V_{I N}-V_{L E D}-I_{A V G} *\left(R_{S}+r_{L}+R_{L X}\right)} \tag{3}
\end{equation*}
$$

Off Time for LX Switch (toffmin>200ns):

$$
\begin{equation*}
t_{\text {OFF }}=\frac{L * \Delta I}{V_{L E D}+V_{D}+I_{A V G} *\left(R_{S}+r_{L}\right)} \tag{4}
\end{equation*}
$$

Where:

| Symbol |  |
| :--- | :--- |
| L | L1 coil inductance in H |
| $\Delta \mathrm{I}$ | L1 coil peak-peak ripple current in A (internally set to $0.3 * \mathrm{I}_{\mathrm{AVG}}$ ) |
| $\mathrm{V}_{\mathrm{IN}}$ | Supply voltage in V |
| $\mathrm{V}_{\mathrm{LED}}$ | Total forward voltage in V for LED string |
| $\mathrm{I}_{\mathrm{AVG}}$ | Nominal average LED current in A |
| Rs | External current sense resistor in $\Omega$ |
| $\mathrm{r}_{\mathrm{L}}$ | L1 coil resistance in $\Omega$ |
| $\mathrm{R}_{\mathrm{LX}}$ | LX switch resistance in $\Omega$ |
| $\mathrm{V}_{\mathrm{D}}$ | D1 diode forward voltage at the required load current in V |

August 16, 2011

The inductance value has an equivalent effect on $t_{O N}$ and $t_{\text {oFF }}$ and therefore affects the switching frequency. For the same reason, the inductance has no influence on the duty cycle, for which the relationship of the summed LED forward voltages $n$ * $\mathrm{V}_{\mathrm{F}}$ to the input voltage $\mathrm{V}_{\mathbb{N}}$ is a reasonable approximation. Because the input voltage is a factor in the ON time, variations in the input voltage affect the switching frequency and duty cycle.
To achieve optimum performance, duty cycles close to 0.5 at the nominal average supply voltage are preferable for improving the temperature stability of the output current.
Equations (5), (6), (7), and (8) provide an example of calculating $\mathrm{t}_{\mathrm{ON}}$, $\mathrm{t}_{\mathrm{OFF}}$, operating frequency $\mathrm{f}_{\mathrm{L}}$, and duty cycle $\mathrm{D}_{\mathrm{LX}}$ when using a $220 \mu \mathrm{H}$ inductor for L 1 and $\mathrm{V}_{\mathbb{I N}}=12 \mathrm{~V}, \mathrm{Rs}=0.30 \Omega, \mathrm{r}_{\mathrm{L}}=0.26 \Omega, \mathrm{~V}_{\mathrm{LED}}=3.4 \mathrm{~V}, \mathrm{I}_{\mathrm{AVG}}=333 \mathrm{~mA}, \mathrm{~V}_{\mathrm{D}}=0.36 \mathrm{~V}$, and $R_{L x}=0.27 \Omega$.

Example:

$$
\begin{align*}
& t_{\text {ON }}=\frac{220 \mu H * 0.3 * 0.333 \mathrm{~A}}{12 V-3.4 V-0.333 A *(0.3 \Omega+0.26 \Omega+0.27 \Omega)}=2.64 \mu \mathrm{~s} \\
& t_{\text {OFF }}=\frac{220 \mu H * 0.3 * 0.333 \mathrm{~A}}{3.4 V+0.36 \mathrm{~V}+0.333 \mathrm{~A}(0.30 \Omega+0.26 \Omega)}=5.56 \mu \mathrm{~s} \\
& f_{L X}=\frac{1}{T_{\text {ON }}+T_{\text {OFF }}}=\frac{1}{2.64 \mu \mathrm{~s}+5.56 \mu \mathrm{~s}}=121.8 \mathrm{kHz} \\
& D_{L X}=\frac{V_{L E D}}{V_{\text {IN }}}=\frac{3.4 V}{12 V} \approx \frac{T_{\text {ON }}}{T_{\text {ON }}+T_{\text {OFF }}}=\frac{2.64 \mu \mathrm{~s}}{2.64 \mu \mathrm{~s}+5.56 \mu \mathrm{~s}} \approx 0.3 \tag{8}
\end{align*}
$$

For the L1 inductor, use a coil with a continuous current rating higher than the required mean output current and a saturation current that exceeds the peak output current by $30 \%$ to $50 \%$ for robustness against transient conditions; e.g., during start-up.

### 3.3.3 Bypass Capacitor C1

The bypass capacitor C 1 has two functions: maintaining operating voltage and bypassing the current ripple of the switching converter. In general, low ESR capacitors must be used.
If the circuit is supplied by rectified line voltage, C1 must provide enough charge to maintain the ZLED7×30's minimum operating voltage as well as the forward voltage of the LED string to keep the application working even if the rectified supply voltage periodically drops below these values. A rough estimate for the minimum capacity needed can be calculated with equation (9).

The material contained herein may not be reproduced, adapted, merged, translated, stored, or used without <br> the prior written consent of the copyright owner. The information furnished in this publication is subject to changes without notice. |
| :--- | :--- | :--- |

$$
\begin{equation*}
C 1_{M I N}=\frac{I_{A V G} * t_{D}}{\Delta V_{M A X}}=\frac{I_{F} * D_{L X}}{\Delta V_{M A X} * f_{L X}} \tag{9}
\end{equation*}
$$

Where:

| Symbol | Description |
| :--- | :--- |
| $\mathrm{I}_{\text {AVG }}$ | Average nominal LED string current assuming that the contribution of the IC supply current is <br> negligible. |
| $t_{D}$ | Discharge time at given AC frequency. Will be a maximum of $10 \mathrm{~ms}(1 / 2$ period duration $)$ at 50 Hz. |
| $\Delta \mathrm{~V}_{\text {MAX }}$ | Peak rectified supply voltage minus LED string forward voltage or minimum ZLED $7 \times 30$ supply <br> voltage, whichever is greater. |

Example: For an application with 3 LEDs with 3.2 V forward voltage each driven at 0.33 A and supplied with rectified 24 VAC , a minimum bypass capacitor C 1 of $220 \mu \mathrm{~F}$ or $330 \mu \mathrm{~F}$ might be adequate. Compared to the calculation, a safety margin of about $50 \%$ must be added to consider temperature effects and aging.

$$
\begin{equation*}
C 1_{M I N}=\frac{0.33 A * 10 m s}{24 V * \sqrt{2}-3 * 3.2 V}=135 \mu F \tag{10}
\end{equation*}
$$

A second function of C 1 is to bypass the current ripple of the switching converter and thus prevent it from disturbing a stable IC supply or backlash on the power supply circuit. For this reason even in DC-supplied applications, the use of an adequate C1 might be useful. The defining parameters are now as shown in equation (11):

$$
\begin{equation*}
C 1_{M I N}=\frac{I_{A V G} * t_{O N}}{V_{\text {ripple }}} \tag{11}
\end{equation*}
$$

## Where:

| Symbol | Description |
| :--- | :--- |
| $I_{\text {Avg }}$ | Average nominal LED string current. |
| $\mathrm{t}_{\mathrm{ON}}$ | ON time of the internal MOSFET output switch. <br> Note: ton must be longer than toNmin=200ns. |
| $\mathrm{V}_{\text {ripple }}$ | Permissible voltage ripple on the supply voltage. |

Example: For an application of 3 LEDs driven at 0.33 A and supplied with 24 VDC , a maximum ripple of $10 \%$ is allowed. The ZLED7x30 is operated at 150 kHz with a duty cycle of 0.4 leading to an ON time of $2.67 \mu \mathrm{~s}$. As calculated in equation 12, a capacitor C1 of 470 nF may be adequate, again including a safety margin of about 50\%.

$$
\begin{equation*}
C 1_{M I N}=\frac{0.33 A * 2.67 \mu \mathrm{~s}}{24 V * 0.1}=367 n F \tag{12}
\end{equation*}
$$

To achieve maximum stability over temperature and voltage, an $\mathrm{X} 7 \mathrm{R}, \mathrm{X} 5 \mathrm{R}$, or better dielectric is recommended while Y5V must be avoided.

### 3.3.4 De-bouncing Capacitor C2

External capacitor C2 minimizes ground bounce during switching of the internal MOSFET output switch. Ground bounce is typically caused by parasitic inductance and resistance due to the distance between the grounds for the power supply and the ZLED7x30 GND pin. Use a $0.1 \mu \mathrm{~F}$, X7R ceramic capacitor to ground for C 2 .

### 3.3.5 Capacitor C3 for Reducing Output Ripple

If required, the C3 can be used to reduce peak-to-peak ripple current in the LED string. Low ESR capacitors should be used because the efficiency of C3 largely depends on its ESR and the dynamic resistance of the LEDs. For an increased number of LEDs, using the same capacitor will be more effective. Lower ripple can be achieved with higher capacitor values, but this will increase start-up delay by reducing the slope of the LED voltage as well as cause increased current during converter start-up. The capacitor will not affect operating frequency or efficiency. For a simulation or bench optimization, C3 values of a few $\mu \mathrm{F}$ are an applicable starting point for the given configuration. Ripple current reduction is approximately proportional to the value of C3.

### 3.3.6 Diode D1

The flyback diode D1 must have a continuous current rating greater than the maximum output load current and a peak current rating higher than the peak L1 coil current. Important: Use a low-capacitance, fast Schottky diode that has low reverse leakage at the maximum operating temperature and maximum operating voltage for the application to avoid excess power dissipation and optimize performance and efficiency. For silicon diodes, there is a concern that the higher forward voltage and increased overshoot from reverse recovery time could increase the peak LX pin voltage $\left(\mathrm{V}_{\mathrm{LX}}\right)$. The total voltage $\mathrm{V}_{\mathrm{LX}}$ (including ripple voltage) must not be $>50 \mathrm{~V}$.

### 3.4 Application Circuit Layout Requirements

The following guidelines are strongly recommended when laying out application circuits:

- Important: Locate the L1 inductor and the C1 input decoupling capacitor as close as possible to the ZLED7x30 to minimize parasitic inductance and resistance, which can compromise efficiency. Use low resistance connections from L1 to the LX and $\mathrm{V}_{\text {IN }}$ pins.
- All circuit board traces to the LX pin must be as short as possible because it is a high-speed switching node.
- To minimize ground bounce, locate the $0.1 \mu \mathrm{~F}$ external capacitor C 2 as close as possible to the $\mathrm{V}_{\mathbb{I}}$ pin and solder the ZLED7x30's GND pin directly to the ground plane. (Also, see section 3.3.4 regarding ground bounce.)

| :--- | :--- | :--- |

- Because Rs is typically a low value resistor, it is important to consider the resistance of the traces in series with $R_{S}$ as part of the total current sense resistance. Use traces that are as short and wide as possible to minimize this effect.
- The ZLED7×30's DIM pins are high impedance inputs. When left floating, these pins are pulled up to 3.3 V by internal circuitry. Avoid running high voltage traces close to the DIM pins.

## 4 ESD Protection

All pins have an ESD protection of $\geq \pm 3000 \mathrm{~V}$ according to the Human Body Model (HBM). The ESD test follows the Human Body Model with $1.5 \mathrm{k} \Omega / 100 \mathrm{pF}$ based on MIL 883-H, Method 3015.8.

## 5 Pin Configuration and Package

Figure 5.1 ZLED7x30 Pin Configuration

Table 5.1 ZLED7x30 Pin Descriptions-SOP-8 Package

| Pin | No. | Description (Also see section 3.3 for layout guidelines) |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {IN }}$ | 1 | Input voltage (8.5V to 40V). |  |  |
| $I_{\text {SENSE }}$ | 2 | Current adjustment input. Resistor $\mathrm{R}_{\mathrm{S}}$ from $\mathrm{I}_{\text {SENSE }}$ to $\mathrm{V}_{\text {IN }}$ determines the nominal average output current. loutnom $=0.1 \mathrm{~V} / \mathrm{R}_{\mathrm{S}}$ |  |  |
| NC | 3 | Not connected; keep floating. |  |  |
| NC | 4 | Not connected; keep floating. |  |  |
| DIM2 | 5 | Set the number of current levels and current ratio of each level of switch dimming function as follows: |  |  |
|  |  | DIM1 Pin | DIM2 Pin | Dimming Mode |
|  |  | Floating | Floating | No dimming |
| DIM1 | 6 | Floating | GND | Three levels: $100 \%, 50 \%, 20 \%$ |
|  |  | GND | Floating | Three levels: $100 \%$, 60\%, 30\% |
|  |  | GND | GND | Two levels: $100 \%$, 30\% |
| GND | 7 | Connect to GND. |  |  |
| LX | 8 | Drain of internal power switch |  |  |

SOP8 Package Dimensions

Table 5.2 Package Dimensions SOP-8

| Symbol | Dimension (mm) |  | Symbol | Dimension (mm, except $\theta$ ) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Min | Max |  | Min | Max |
| A | 1.350 | 1.750 | $E$ | 3.800 | 4.000 |
| A1 | 0.100 | 0.250 | E1 | 5.800 | 6.240 |
| A2 | $1.450 ~ T y p i c a l ~$ |  | e | 1.270 Typical |  |
| b | 0.350 | 0.490 | L | 0.400 | 1.270 |
| C | 0.178 | 0.250 | $\theta$ | $0^{\circ}$ | $8^{\circ}$ |
| D | 4.800 | 5.000 |  |  |  |

The SOP-8 package has a thermal resistance (junction to ambient) of $R_{\text {өJA }}=128 \mathrm{~K} / \mathrm{W}$.

## 6 Ordering Information

## Ordering Information

| Product Sales Code | Description | Package |
| :--- | :--- | :--- |
| ZLED7030-ZI1R | ZLED7030 - High Current (1200mA) 40V LED Driver with Switch Dimming | SOP-8 (Tape \& Reel) |
| ZLED7330-ZI1R | ZLED7330 - High Current (1000mA) 40V LED Driver with Switch Dimming | SOP-8 (Tape \& Reel) |
| ZLED7530-ZI1R | ZLED7330 - High Current (750mA) 40V LED Driver with Switch Dimming | SOP-8 (Tape \& Reel) |
| ZLED7730-ZI1R | ZLED7330 - High Current (350mA) 40V LED Driver with Switch Dimming | SOP-8 (Tape \& Reel) |
| ZLED7030KIT-D1 | ZLED7030 Demo Kit 12VAC/VDC, including 1 ZLED-PCB8 | Kit |
| ZLED-PCB8 | Test PCB with one 5W white High Brightness (HB) LED, cascadable to one <br> multiple LED string | Printed Circuit Board (PCB) |
| ZLED-PCB2 | 10 unpopulated test PCBs for modular LED string with footprints of 9 common <br> HB LED types | Printed Circuit Board (PCB) |
