An ON Semiconductor Company

## LV5026M - LED Driver IC

## Overview

LV5026M is a High Voltage LED drive controller which drives LED current up to 3A with external MOSFET.
LV5026M is realized very simple LED circuits with a few external parts. It corresponds to various wide dimming controls including the TRIAC dimming control.

## Functions

- High Voltage LED Controller
- Various Dimming Control
-TRIAC \& Analog Input \& PWM Input
- Soft Start function
- Built-in TRIAC stabilized function
- Built-in circuit of detection of overvoltage of CS pin.
- Selectable Switching frequency [ 50 kHz or 70 kHz , open: 50 kHz ]

## Specifications

Maximum Ratings at $\mathrm{Ta}=25^{\circ} \mathrm{C}$

| Parameter | Symbol | Conditions | Ratings | Unit |
| :--- | :--- | :--- | ---: | :---: |
| Maximum Input voltage | VIN max |  | -0.3 to 42 | V |
| REF_OUT, REF_IN, RT, <br> CS, PWM_D, ACS |  |  | -0.3 to 7 | V |
| OUT1 pin |  |  | -0.3 to 42 | V |
| OUT2 pin | VOUT_abs |  | -0.3 to 42 | V |
| Allowable power dissipation | PouT2_abs |  |  | 1.0 |
| Junction temperature | Tj | With specified board ${ }^{*}$ | W |  |
| Operating temperature | Topr |  | 150 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature | Tstg |  | -30 to +125 | ${ }^{\circ} \mathrm{C}$ |

*Specified board: $58.0 \times 54.0 \times 1.6 \mathrm{~mm}$ (glass epoxy board)

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.
$\square$ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Recommended Operating Conditions at $\mathrm{Ta}=25^{\circ} \mathrm{C}$

Pin Functions

| pin No | Pin Name | Pin Function | Equivalent Circuit |
| :---: | :---: | :---: | :---: |
| 1 | RT | Switching Frequency selection pin. L or Open : 50 kHz Switching, H: 70 kHz Switching. <br> In case of 70 kHz , connect RT pin to REFOUT pin. on time |  |
| 2 | REF_OUT | Built-in 3V Regulate out Pin. <br> If this function isn't used, please connect to nothing. |  |
| 3 | REF_IN | External LED current Limit Setting pin. If less than VREF $(0.61 \mathrm{~V})$ voltage is input, Peak current value is used at the input voltage. If more than REF_IN voltage is input, it is done at VREF voltage. If this function isn't used, please connect nothing. |  |
| 4 | CS | LED current sensing in. If this terminal voltage exceeds VREF (Or REF_IN), external FET is OFF. And if the voltage of the terminal exceeds 1.9 V , LV5026M turns to latch-off mode. |  |
| 5 | PWM_D | PWM Dimming pin.L or open: normal operation, <br> H: Stop operation. |  |
| 6 | GND | GND pin. |  |
| 7 | OUT | Driving the external FET Gate Pin. | - ${ }^{\circ}$ OVIN |
| 8 | VIN | Power supply pin. Operation : VIN $>$ UVLOONStop: VIN<UVLOOFF Switching Stop: VIN>VINOVP |  |
| 9 | OUT2 | This pin drive the FET which is stabilized the TRIAC dimming application. <br> If ACS is less than 3V, OUT2 turn High voltage. If this function isn't used, please connect nothing. |  |
| 10 | ACS | ACS pin senses AC Voltage. If this function isn't used, please connect GND. |  |

## - LED current and inductande setting

## Relation ship beween REF_IN and CS pin voltage(Power Factor Crrection(PFC))

The output current value is the average of the current value that flows during one cycle. The current value that flows into coil is a triangular wave shown in the figure below. Make sure to set Ipk so that (average of current value at one cycle) is equal to (LED current value).Ipk is set by the relationship between REF_IN voltage and Rcs voltage. This relationship make Power Factor Correction (PFC).Therefore, it is available to make LED current a sine curve.

## Setting Zener voltage

Vzd depend on LED voltage (VF). Choose Zener diode around Vf (LED voltage). When VAC voltage is lower than Vf, LED operation is not normal. Using Zener diode prevents incorrect operating during VAC voltage lower than Vf.In detail, refer to [LED current and inductance setting]
In case of REF_IN pin open, this error amplifier negative input(-) is under control of internal VREF voltage(0.605Vtyp).

$I p k=\frac{(V a c-V z d) \times \frac{R 2}{R 1+R 2}}{R c s}$
Ipk: peak inductor current Vf: LED forward voltage drop
Vac: effective value,R.M.S value
VREF: Built-in reference voltage ( 0.605 V )
VREF_IN:REF_IN voltage(6 pin)
Rs: External sense resistor
Vzd:Zener diode voltage(REF_IN pin)

## LED current and inductance setting

It is available to use both no-isolation and isolation applications.

## (For non-isolation application)

The output current value is the average of the current value that flows during one cycle. The current value that flows into coil is a triangular wave shown in the figure below. Make sure to set IL_PK so that (average of current value at one cycle) is equal to (LED current value).

Given that the period when current flows into coil is
, DutyI $=\frac{T_{-} c+T_{-} d}{T}$
$I p k \times \frac{1}{2} \times(D u t y I \times T) / T=I L E D$
$I p k=\frac{2 \times I L E D}{\text { DutyI }} \quad$ (1) since $\quad I p k=\frac{V R E F_{-} I N}{R c s}$
$R c s=\frac{V F E F_{\_} I N}{I p k}=\frac{D u t y I \times V R E F_{\_} I N}{2 I L E D}$

Ipk: peak inductor current
Vf: LED forward voltage drop
Vac: effective value(R.M.S value)
VREF: Built-in reference voltage ( 0.605 V )
VREF_IN:REF_IN voltage( 6 pin)
Rs: External sense resistor
Vzd:Zener diode voltage(REF_IN pin)

Since formula for LED current is different between on period and off period as shown above,
$I p k=\frac{V a c-V f}{L} \times T_{-} c=\frac{V f}{L} \times T_{-} d$
Since $\quad T_{-} c+T_{-} d=D u t y I \times T, T_{-} c=D u t y I \times T-T_{-} d$
Based on the result of (3) and (4), $T_{-} d=D u t y I \times T \times \frac{V a c-V f}{V a c}$
To obtain $L$ from the equation (1), (3), (5),
$L=\frac{V f \times D u t y I}{2 \times I L E D} \times D u t y I \times T \times \frac{V a c-V f}{V a c}=\frac{V f}{2 \times I L E D} \times \frac{1}{f o s c} \times \frac{V a c-V f}{V a c} \times(D u t y I)^{2}$
Since LED and inductor are connected in serial in non-isolation mode, LED current flows only when AC voltage exceed VF.

Given that the ratio of inductor current to AC input is DutyAC.
Duty $A C=\frac{90-\arcsin \left(\frac{V f}{\sqrt{2} V r m s}\right)}{90}$
Since the period when the inductor current flows are limited by DutyAC, the formula (6) is represented as follows:
$L=\frac{V f}{2 \times I L E D} \times \frac{1}{f o s c} \times \frac{V a c-V f}{V I N} \times(D u t y I)^{2} \times\left(\frac{90-\arcsin \left(\frac{V f}{\sqrt{2} V r m s}\right)}{90}\right)^{2}$

## (for Isolation circuit)

Using the circuit diagram below, the wave form of the current that flows to Np and Ns is as follows. Current waveform flows to primary side and secondary.

[Inductance Lp of primary side and sense resistor Rs]
If a peak current flow to transformer is represented as Ipk_p, the power (Pin) charged to the transformer on primary side can be represented as:

$$
\begin{align*}
& \text { Pin }=\frac{1}{2} \times L p \times\left(I p k_{-} p\right)^{2} \times f o s c  \tag{11}\\
& \because I p k_{-} p=\frac{V a c}{L p} \times \text { Ton }_{-} p  \tag{12}\\
& \therefore L p=\frac{V^{2} c^{2} \times \text { Ton_ }_{-} p^{2} \times f o s c}{2 \times \text { Pin }}=\frac{V a c^{2} \times \text { Don }_{-} p^{2}}{2 \times \text { Pin } \times \text { fosc }} \tag{13}
\end{align*}
$$

$\left(\right.$ Don $_{-} p=\frac{\text { Ton_p }^{p}}{T}=$ Ton $_{-} p \times$ fosc $)$,
To substitute the following to the formula below,

$$
\begin{align*}
& \because \eta=\frac{\text { Pout }}{\text { Pin }}  \tag{14}\\
& \therefore L p=\frac{\text { Vac }^{2} \times \text { Ton }_{-} p^{2} \times \text { fosc } \times \eta}{2 \times \text { Pout }}=\frac{\text { Vac }^{2} \times \text { Don }^{2} \times \eta}{2 \times \text { Pout } \times \text { fosc }} \tag{15}
\end{align*}
$$

Sense resistor is obtained as follows.
$R s=\frac{V R E F_{\_} I N}{I p k_{-} p}=\frac{V R E F_{\_} I N \times L p}{V a c \times T o n_{-} p}=\frac{V R E F_{\_} I N \times L p}{V a c \times D_{o n} p \times T}$
[Inductance Ls of secondary side]
Since output current Iout is the average value of current flows to transformer of secondary side
$I o u t=I p k_{-} s \times \frac{T o n_{-} s}{T} \times \frac{1}{2}=\frac{I p k_{-} s \times D o n_{-} s}{2} \quad\left(D o n_{-} s=\frac{\text { Ton_ }_{-} s}{T}=\right.$ Ton $\left.s \times f o s c\right)$
$I p k_{-} s=\frac{\text { Vout }}{L s} \times$ Ton $_{-} s=\frac{\text { Vout }}{L s} \times \frac{\text { Don_s } s}{\text { fosc }}$
$L s=\frac{\text { Vout } \times T \times \text { Don_ }_{-} s^{2}}{2 \times \text { Iout }}=\frac{\text { Vout } \times \text { Don_ }_{-} s^{2}}{2 \times \text { Iout } \times \text { fosc }}=\frac{\text { Vout }^{2} \times \text { Don_ }_{-} s^{2}}{2 \times \text { Pout } \times \text { fosc }}$
Calculation of the ratio of transformer coil on primary side and secondary side Since ratio and inductance of transformer coil is
$\frac{N s}{N p}=\frac{\sqrt{L s}}{\sqrt{L p}}$
substituted equations (15), (19) for (20)
$\therefore \frac{N p}{N s}=\frac{V a c}{\text { Vout }} \times \sqrt{\eta} \times \frac{\text { Don }_{-} p}{\text { Don_s }_{-}}$
Calculation of transformer coil on primary side and secondary side
$N=\frac{V a c \times 10^{8}}{2 \times \Delta B \times A e \times f o s c}$
$\Delta \mathrm{B}$ : variation range of core flux density [Gauss]
Ae : core section area $\left[\mathrm{cm}^{2}\right]$
To use Al ( L value at 100T),
$N=\sqrt{\frac{L}{A l}} \times 10^{2}$
L : inductance [ uH ]
Al : L value at $100 \mathrm{~T}\left[\mathrm{uH} / \mathrm{N}^{2}\right]$
$\lg$ (Air gap) is obtained as follows:
$\lg =\frac{\mu_{r} \mu_{0} N^{2} A_{e} 10^{2}}{L}$
$\mu_{\mathrm{r}}$ : relative magnetic permeability, $\mu_{\mathrm{r}}=1$
$\mu_{0}$ : vacuum magnetic permeability $\mu_{0}=4 \pi^{*} 10^{-7}$
N : turn count [T]
Ae : core section area $\left[\mathrm{m}^{2}\right]$
L: inductance [ H ]

## LV5026M

## Bleeder current cuircuit for TRIAC dimmer

1. Operating voltage setting

ACS pin voltage set operating voltage at OUT2. ACS pin threshold volage is 3 Vtyp .
OUT2 operating voltage is set by R1 and R2. R1 and R2 is determined below.

$$
A C S=V a c \times \frac{R 2}{R 1+R 2}
$$

2. Bleeder current setting

Rd set hold current at Triac dimmer.
Bleeder current is set at Rd depending on Triac dimmer.

## Description of operation

## protection function

|  | tilte | outline | monitor point | note |
| :--- | :--- | :--- | :--- | :--- |
| 1 | UVLO | Under Voltage Lock Out | VCC voltage |  |
| 2 | OCP | Over Current Protection | CS voltage | available FET current |
| 3 | OVP | Over Voltage Protection | VCC voltage |  |
| 4 | OTP <br> (TSD) | Over Temperature Protection <br> (Thermal Shut Down)) | PN Junction temperature |  |

## 1.UVLO(Under Voltage Lock Out)

If VIN voltage is 7.3 V or lower, then UVLO operates and the IC stops. When UVLO operates, the power supply current of the IC is about 80 uA or lower. If VIN voltage is 9 V or higher, then the IC starts switching operation.

## 2.OCP(Over Current Protection)

The CS pin sense the current through the MOS FET switch and the primary side of the transformer.This provides an additional level of protection in the event of a fault. If the voltage of the CS pin exceeds VCSOCP $(1.9 \mathrm{Vtyp})(\mathrm{A})$, the iternal comparator will detect the event and turn off the MOSFET. The peak switch current is calculated Io(peak) [A] = VSOCP[V]/Rsense[ohm]
The VCC pin is pulled down to fixed level, keeping the controller lached off.The lach reset occurs when the user disconnects LED from VAC and lets the VCC falls below the VCC reset voltage,UVLOOFF(7.3Vtyp)(B). Then VCC rise UVLOON(9Vtyp)(C),restart the switching.

## 3.OVP(Over Voltage Protection)

If the voltage of VIN pin is higher than the internal reference voltage VINOVP(27Vtyp),switching operation is stopped. The stopping operation is kept until the voltage of VIN is lower than 7.3 V . If the voltage of VIN pin is higher than 9 V , the switching operation is restated.

## 4. TSD(thermal Shut Down protection

The thermal shutdown function works when the junction temperature of IC is 165deg (typ) (A), and the IC switching stops. The IC starts switching operation again when the junction temperature is $135^{\circ} \mathrm{Ctyp}(\mathrm{B})$ or lower.

## Skip frequency function

LV5026M contains the skip frequency function for reduction of the peak value of conduction noise. This function changes the frequency as follows.

## Skip Frequency Function

Switching frequency is changed as follows.
$\ldots \times 0.9 \rightarrow \times 1.1 \rightarrow \times 1.05 \rightarrow \times 1 \rightarrow \times 0.95 \rightarrow \times 0.9 \rightarrow \times 1.1 \ldots$
It's repeated by this loop.

## LV5026M

## PWM dimmer function

LED current can be adjusted according to Duty of PWM pulse input to PWM dimmer pin. PWM pulse is High (2V to 5 V ) then switching operation stops, and LED current stops flowing. PWM pulse is Low (under 0.6V), then switching operation stop is released, and it returns to normal operation.
