AAT4610B

Current Limited Load Switch

General Description

The AAT4610B SmartSwitch is a current limited P-channel MOSFET power switch designed for high-side load switching applications. This switch operates with inputs ranging from 2.4V to 5.5V, making it ideal for both 3V and 5V systems. An integrated current-limiting circuit protects the input supply against large currents which may cause the supply to fall out of regulation. The AAT4610B is also protected from thermal overload which limits power dissipation and junction temperatures. It can be used to control loads that require up to 1A. Current limit threshold is programmed with a resistor from SET to ground. The quiescent supply current is typically a low 9µA. In shutdown mode, the supply current decreases to less than 1µA.

The AAT4610B is available in a Pb-free 5-pin SOT23 or 8-pin SC70JW package and is specified over the -40°C to +85°C temperature range.

Application Information

Setting Current Limit

In most applications, the variation in I_{LIM} must be taken into account when determining $R_{SET.}$ The I_{LIM} variation is due to processing variations from part to part, as well as variations in the voltages at IN and OUT, plus the operating temperature. See charts "Current Limit vs. Temperature" and "Output Current vs. V_{OUT}." Together, these three factors add up to a ±25% tolerance (see I_{LIM} specification in Electrical Characteristics section). Figure 1 illustrates a cold device with a statistically higher current limit and a hot device with a statistically lower current limit, both with R_{SET} equal to 8.87kΩ. While the chart, "R_{SET} vs. I_{LIM}" indicates an I_{LIM} of 1.1A with an R_{SET} of 10.5kΩ, this figure shows that the actual current limit will be at least 0.825A and no greater than 1.375A.

To determine $R_{SET,}$ start with the maximum current drawn by the load and multiply it by 1.33 (typical I_{LIM} = minimum I_{LIM} / 0.75). This is the typical current limit value. Next, refer to "R_{SET} vs. I_{LIM}" and find the R_{SET} that corresponds to the typical current limit value. Choose the largest resistor available that is less than or equal to it. For greater precision, the value of R_{SET} may also be calculated using the I_{LIM} R_{SET} product found in the chart "R_{SET} Coefficient vs. I_{LIM}." The maximum current is derived by multiplying the typical current for the chosen R_{SET} in the chart by 1.25. A few standard resistor values are listed in Table 1.

Table 1: Current Limit R_{SET} Values

Example: A USB port requires 0.5A. 0.5A multiplied by 1.33 is 0.665A. From the chart named "R_{SET} vs. I_{LIM}," R_{SET} should be less than 18kΩ. 17.8kΩ is a standard value that is a little less than 18kΩ but very close. The chart reads approximately 0.525A as a typical I_{LIM} value for 17.8kΩ. Multiplying 0.525A by 0.75 and 1.25 shows that the AAT4610B will limit the load current to greater than 0.394A but less than 0.656A.

Operation in Current Limit

When a heavy load is applied to the output of the AAT4610B, the load current is limited to the value of I_{LIM} determined by R_{SET} (see Figure 2). Since the load is demanding more current than I_{LIM}, the voltage at the output drops. This causes the AAT4610B to dissipate a larger than normal quantity of power, and its die temperature to increase. When the die temperature exceeds an over-temperature limit, the AAT4610B will shut down until is has cooled sufficiently, at which point it will startup again. The AAT4610B will continue to cycle on and off until the load is removed, power is removed, or until a logic high level is applied to ON.

Enable Input

In many systems, power planes are controlled by integrated circuits which run at lower voltages than the power plane itself. The enable input ON of the AAT4610B has low and high threshold voltages that accommodate this condition. The threshold voltages are compatible with 5V TTL and 2.5V to 5V CMOS.

Reverse Voltage

The AAT4610B is designed to control current flowing from IN to OUT. If a voltage is applied to OUT which is greater than the voltage on IN, large currents may flow. This could cause damage to the AAT4610B.
