

PC Card (PCMCIA) Interface Switch

FEATURES

- Single SO-16 Package
- CMOS Inputs with Hysteresis
- Extremely Low R_{ON}
- Reverse Blocking Switches
- HiZ Outputs in the Off-State
- Low Power Consumption
- Safe Power-Up

DESCRIPTION

The Si9711 is a monolithic switch designed to meet the needs of the PC Card interface. The inputs are fully CMOS compatible and incorporate all the level shift and interface required to be driven by any CMOS driver. The external inputs can be driven to 3.3-V or 5-V by setting V_L at the appropriate level. The switches are low R_{ON} and can carry the maximum currents found on the PC Card interface.

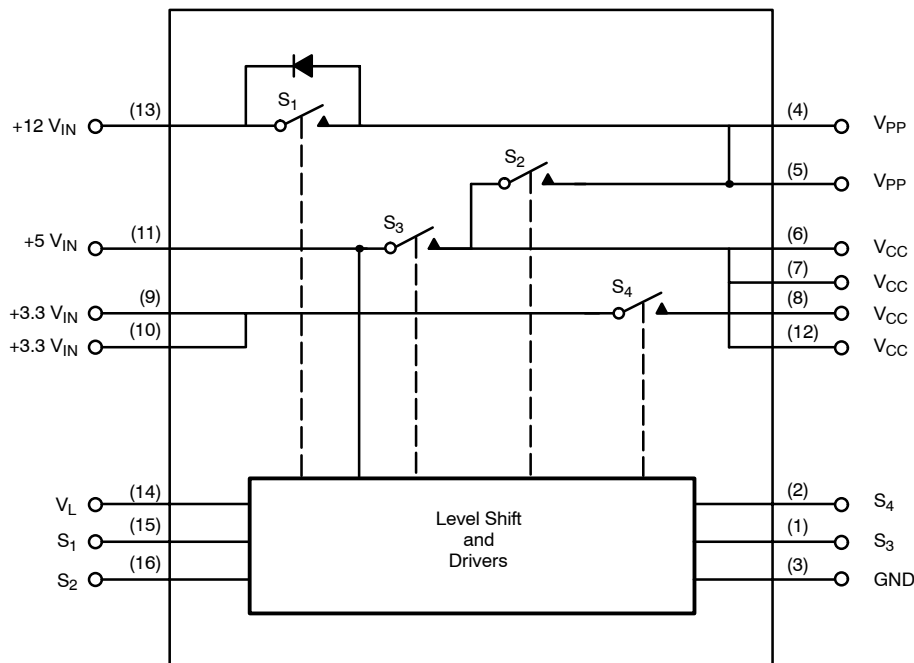

The 5-V and 3.3-V switches do not have the parasitic diode found in vertical DMOS power switches.

Low R_{ON} is achieved by using MOSFETs driven off the +12- V_{IN} input. All level shifting is built into the Si9711.

The Si9711 is packaged in an SO-16 package and is rated over the commercial temperature range 0 to 70°C.

The Si9711 is available in both standard and lead (Pb)-free packages.
