32-Channel Serial To Parallel Converter
With Open Drain Outputs

Features

► Processed with HVCMOS® technology
► Sink current minimum 100mA
► Shift register speed 16MHz
► Polarity and blanking inputs
► CMOS compatible inputs

Applications

► Inkjet and Electrostatic Print Heads
► AC-Electroluminescent Displays
► MEMS Applications

General Description

The HV5623 is a low-voltage serial to high-voltage parallel converter with open drain outputs. This device has been designed for use as a driver for AC-electroluminescent displays. It can also be used in any application requiring multiple output high voltage current sinking capabilities, such as driving inkjet and electrostatic print heads, plasma panels, and vacuum fluorescent or large matrix LCD displays.

This device consists of a 32-bit shift register, 32 latches, and control logic to perform the polarity selection and blanking of the outputs. Data are shifted through the shift register on the high to low transition of the clock. The HV5623 shifts in a clockwise direction when viewed from the top of the package. A data output buffer is provided for cascading devices. This output reflects the current status of the last bit of the shift register. Operation of the shift register is not affected by the $\overline{LE}$ (latch enable), $\overline{BL}$ (blanking), or $\overline{POL}$ (polarity) inputs. Transfer of data from the shift register to the latch occurs when the $\overline{LE}$ (latch enable) input is high. The data in the latch is stored when $\overline{LE}$ is low.

1. A Pin 1 identifier must be located in the index area indicated. The Pin 1 identifier can be: a molded mark/identifier; an embedded metal marker; or a printed indicator.
2. Depending on the method of manufacturing, a maximum of 0.15mm pullback (L1) may be present.
3. The inner tip of the lead may be either rounded or square.
