Chapter 1

TWR-P1025 Overview

1.1 Introduction

The TWR-P1025 is a Tower Controller Module compatible with the Freescale Tower System. It can function as a stand-alone, low-cost platform for the evaluation of the QorIQ P1xxx family of microprocessor (MPU) devices. The TWR-P1025 features the QorIQ P1025 dual core processor based on the PowerPC® e500 core architecture.

The TWR-P1025 is available as a stand-alone product or can be combined with the Tower Elevator Modules (TWR-ELEV) and other Tower eco-system components to create development platforms for a wide variety of applications. Figure 1-1 shows an overview of the Freescale Tower System.

Figure 1-1. Freescale Tower System

1.2 Contents

The TWR-P1025 contents include:

- TWR-P1025 board
- Quick Start Guide

1.3 Features

The features of the TWR-P1025 Tower MPU Module:

- Tower compatible microprocessor module
- Dual core P1025 in a 561 TEPBGA package operating up to 533 MHz
- P1025 JTAG
- CPLD JTAG
- Three axis accelerometer (MMA8451Q)
- Two (2) user-controllable LEDs
- One (1) reset pushbutton switch
- Ten-way DIP Switch for configuration
- microSD card slot
- mini-PCIe slot
- Two (2) 10/100/1000Mbps Ethernet RJ45
- Two (2) USB2.0 Type A
- One (1) mini-USB TypeB dual UART
- 512 MB DDR3@667 MHz
- 64 MB Flash
- IEEE1588 pinned to header + DAC and VXCO (DNP option)

[Figure 1-2](#) and [Figure 1-3](#) show the TWR-P1025 with some of the key features.

Figure 1-2. Callouts on front side of the TWR-P1025

Figure 1-3. Callouts on back side of the TWR-P1025

1.4 Getting Started

Follow the printed Quick Start Guide or the interactive DVD contained in the TWR-P1025 box for recommended get started steps.

1.5 QorIQ P1025 Device Notification

The TWR-P1025 may be populated with either of the following QorIQ P1025 part numbers as indicated on a sticker on the underside of the module:

- P1025NSN5DFB, which is a non-encrypted, standard temperature device, or
- P1025NSE5DFB, which is encrypted, standard temperature device.

NOTE

For Tower modules populated with the QorIQ P1025 part number P1025NSN5DFB device, the SEC will be disabled on silicon, so features such as IPSEC in the Linux BSP will not be available.

1.6 Reference Documents

For more information on the QorIQ family, Tower System, and MPU Modules refer following documents:

- TWR-P1025-QSG: Quick Start Guide
- TWR-P1025-SCH: Schematics
- TWR-P1025-PWA: Design Package
- P1025 Reference Manual

Chapter 2

Power Requirements

2.1 Overview

The TWR-P1025 is designed to be externally powered through barrel connector J2 from a 5V@5A DC supply. The barrel connector is manufactured by SWITCHCRAFT with part number RAPC722X. The mating plug should have an inner diameter of 2.1mm and outer diameter of 5.5mm. [Figure 2-1](#) shows the polarity of the barrel connector.

Figure 2-1. Power Supply Barrel Connector (J2) Polarity

The 5V input is used to generate all voltages on the board. Additionally when used with TWR elevators and other TWR peripherals, the TWR-P1025 provides 5V and 3.3V supplies.

There are several expansion options on the board that allow external boards to interface to the TWR-P1025, such as the mini PCIe connector, USB ports and elevator expansion. As these plug in cards have variable power requirements as well as numerous population combinations the Power capability of the different expansion interfaces and the core board are listed in [Table 2-1](#). Consideration of total available power from the external supply should be considered when adding plug-in devices or using the elevator expansion.

Table 2-1. Power Distribution Summary

	Voltage (V)	Current (A)	Comment
Main Board	5	2.5A	
MiniPCIe	3.3	1A	
	1.5	0.5	
USB Port 1	5	0.5	
USB Port 2	5	0.5	
ELEVATORS	5	0.5	
	3.3	0.5	

Chapter 3 Hardware Description

The TWR-P1025 is a Tower Controller Module featuring the P1025-a dual core e500v2 based microprocessor in a 561 TEPBGA package with a maximum core operating frequency of 533MHz. It is intended to be used stand-alone or in the Freescale Tower System. Power is supplied through a 5V barrel connector. Figure 3-1 shows a block diagram of the TWR-P1025. The following sections describe the hardware in more detail.

Figure 3-1. TWR-P1025 Block Diagram

3.1 P1025 Microprocessor

The TWR-P1025 module features the P1025, the key features are:

- 533 MHz maximum core operating frequency
- 561 TEPBGA, 23mm x 23mm, 1.0mm pitch package

- Dual high-performance 32-bit cores, built on Power Architecture® technology:
 - 32-bit e500v2 PowerPC core
 - 36-bit physical addressing
 - Double-precision floating-point support
 - 32 Kbyte L1 instruction cache and 32 Kbyte L1 data cache for each core
 - 400 MHz to 533 MHz clock frequency
- 256 Kbyte L2 cache with ECC. Also configurable as SRAM and stashing memory.
- Three 10/100/1000 Mbps enhanced three-speed Ethernet controllers (eTSECs)
 - TCP/IP acceleration, quality of service, and classification capabilities
 - IEEE® 1588 support
 - Lossless flow control
 - MII, RMII, RGMII, SGMII
- High-speed interfaces supporting various multiplexing options:
 - Four SerDes upto 2.5 GHz/lane multiplexed across controllers
 - Two PCI Express interfaces
 - Two SGMII interfaces
- High-speed USB controller (USB 2.0)
 - Host and device support
 - Enhanced host controller interface (EHCI)
 - ULPI interface to PHY
- Enhanced secure digital host controller (SD/MMC)
- Enhanced serial peripheral interface (eSPI)
- Integrated security engine
 - Protocol support includes ARC4, 3DES, AES, RSA/ECC, RNG, single-pass SSL/TLS
 - XOR acceleration
- 32-bit DDR3 SDRAM memory controller with ECC support
- Programmable interrupt controller (PIC) compliant with OpenPIC standard
- One four-channel DMA controller
- Two I2C controllers, DUART, timers
- Enhanced local bus controller (eLBC)
- QUICC Engine block

3.2 Clocking

The P1025 takes a single input clock, SYSCLK, as its primary clock source for the e500 cores and all of the devices and interfaces that operate synchronously with the core. As shown in [Figure 3-1](#), the SYSCLK input (frequency) is multiplied up using a phase lock loop (PLL) to create the core complex bus (CCB) clock (also called the platform clock). The CCB clock is used by virtually all of the synchronous system logic, including the L2 cache, and other internal blocks such as the DMA and interrupt controller. The CCB

clock also feeds the PLLs in the e500 core and the PLL that create clocks for the integrated flash controller. Note that the divide-by-two CCB clock divider and the divide-by-n CCB clock divider, shown in [Figure 3-2](#), are located in the DDR and IFC blocks, respectively.

A SYSCLK of 66.667 MHz will be the default used for the design.

The DDR memory controller complex may use the platform clock or the DDRCLK, which is multiplied up using a separate PLL to create a unique DDR memory controller complex clock. In this case, the DDR complex operates asynchronous with respect to the platform clock and runs at a fixed data rate of 667MTps.

The clocks for the PCI Express and SGMII interfaces are derived from a PLL in the SerDes block. This PLL is driven by a reference clock (SD_REF_CLK/SD_REF_CLK) whose input frequency is a function of the bit rate being used (100 MHz or 125 MHz). Note that for proper PCI Express operation, the CCB clock frequency must be greater than 62.5 MHz.

The Ethernet blocks operate asynchronously with respect to the rest of the device. These blocks use receive and transmit clocks supplied by their respective PHY chips, plus a 125-MHz clock input for gigabit protocols. Data transfers are synchronized to the CCB clock internally.

Figure 3-2. P1025 Clocking Scheme

[Table 3-1](#) and [Table 3-2](#) describe the CCB and core platform frequency ratio selection. [Table 3-3](#) describes the DDRCLK input ratio to DDR controller clock ratio.

The DDR runs at a fixed x10 multiplier to DDR_CLK.

Table 3-1. P1025 CCB to SYSCLK Ratio Selection

Functional Signals	Reset Configuration Name	Value	CCB Clock : SYSCLK Ratio
LA[29:31] No Default	cfg_sys_pll[0:2]	000	4:1
		001	5:1
		010	6:1

Table 3-2. P1025 e500 Core 0 & 1 to CCB Clock Ratio Selection

Functional Signals	Reset Configuration Name	Value	e500 Core: CCB Clock Ratio
LBCTL, LALE, LGPL2/LOE/LFRE No Default	cfg_core0_pll[0:2]	000	Reserved
		001	Reserved
		010	1:1
LWE0, UART_SOUT1, READY_P1 No Default	cfg_core1_pll[0:2]	011	3:2 (1.5:1)
		100	2:1
		101	5:2 (2.5:1)
		110	3:1
		111	Reserved

Table 3-3. P1025 DDR Clock PLL Ratio

Functional Signals	Reset Configuration Name	Value	e500 Core: CCB Clock Ratio
TSEC_1588_CLK_OUT, TSEC_1588_PULSE_OUT1, TSEC_1588_PULSE_OUT2 No Default	cfg_ddr_pll[0:2]	000	3:1
		001	4:1
		010	6:1
		011	8:1
		100	10:1
		101	Reserved
		110	Reserved
		111	Synchronous mode

Table 3-4. CPU Speed Selection

CPU_SPEED_SELECT0 SW1.7	CPU_SPEED_SELECT1 SW1.8	CORE(0 &1) Speed (MHz)	QE Speed (MHz)	SYSCLK (MHz)
ON	ON	533	266	66.667

3.3 System Power

The TWR-P1025 is powered through a barrel connector that provides 5V to the board (and elevators if present). All further operating voltages are generated via onboard regulators.

The power supply should be rated at 5V @5A.

3.4 Debug Interface

There are two JTAG connectors on board, one for the P1025 (J3) and another for the CPLD(J1). Both use standard debuggers available from Freescale and Altera respectively. Pin 1 is marked on both connectors.

Refer to the relevant debug tool for operating instructions.

3.5 Accelerometer

An MMA8451Q digital accelerometer is connected to the P1025 through its second I2C interface at address 0x1C and the accelerometers INT1 signal routed to the P1025 IRQ0.

3.6 Pushbutton and LEDs

The TWR-P1025 features one pushbutton switch connected to a reset circuit. Pressing this button initiates the reset sequence in the CPLD and performs a HRESET sequence to the P1025 as well as resetting the Ethernet PHYs, NOR Flash and USB circuitry.

Two LEDs are available to the user through software control. The P1025 GPIO pins, PB27 and PB31 are routed through the CPLD to control these two LEDs.

3.7 Ethernet

The connectivity between the P1025 and the two Atheros AR8035 GETH PHYs is described in [Table 3-5](#) & [Table 3-6](#) and illustrated in [Figure 3-3](#).

Figure 3-3. eTSEC connection to AR8035 PHY

Table 3-5. eTSEC1 PHY Connectivity

P1025 Signal	P1025 Pin	P1025 Pin Type	Description (for RGMII mode)	AR8035 Signal	AR8035 Pin

EC_MDC	AG19	Output	Management clock	MDC	40
EC_MDIO	AF19	I/O	Management data	MDIO	39

3.8 USB

The P1025 features a USB full-speed/low-speed OTG/Host/Device controller. The controller connects to the USB3300 USB PHY with the USB D+ and D- signals from the USB3300 routed to a four-port USB

hub. Port2 is routed to the miniPCIE connector with Ports 3 & 4 routed to a dual USB type B connector (J5). Both ports 3 & 4 can provide 5V@500mA to peripheral USB devices.

3.9 Micro Secure Digital Card Slot (micro SDHC)

A micro Secure Digital (SD) card slot is available on the TWR-P1025 connected to the SD Host Controller (SDHC) signals of the P1025. Refer to Table 13 "I/O Connectors and Pin Usage Table" for the SDHC signal connection details.

3.10 Local Bus Interface

The P1025 local bus interface is used for the NOR flash and elevator Local bus expansion. The local bus is routed to the CPLD where the LAD lines are demultiplexed.

A Spansion SP29GL512S Flash providing 64Mbytes of memory is used on the P1025 Tower Module to provide code storage for boot and application code. Some of the connections are direct between the P1025's GPCM controlled memory controller and the Flash device. However the data bus is multiplexed with the address bus, therefore a latch/mux is required. Typically this would be implemented in a separate logic device, though the board contains a CPLD that has all these signals routed to it. The latch/mux logic is implemented in the CPLD. The CPLD also drives reset to the Flash device at power up. The interconnect between the devices is illustrated in Figure 3-4.

Additionally a subset of the local bus is routed from the CPLD to the primary elevator. This subset is intended to be used as interface to the TWR-LCD panel.

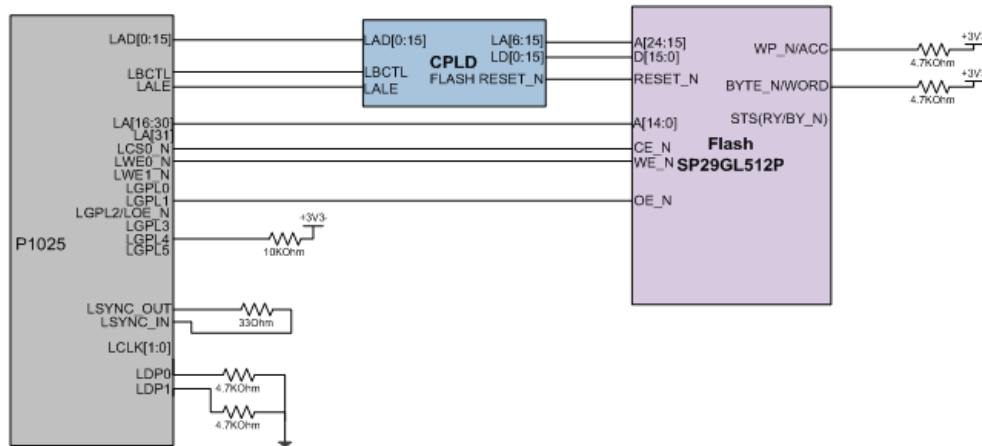

Figure 3-4. NOR Local Bus Connection

3.11 UART

The two P1025 UARTs are routed to the FDTI dual USB to RS232 convertor. The UART is typically used as a terminal on a remote host to provide input and output from the devices operating system, for example, u-boot/Linux.

Serial connectivity for both P1025 cores is provided through the mini type B USB connector (labeled mini USB UART in [Figure 1-3](#)). Note that the USB Drivers should be installed onto the host PC before the serial terminal can be used. These can be downloaded from;

<http://www.ftdichip.com/Drivers/VCP.htm> (FT2232)

A serial terminal can be set up using a PC communication program such as hyper terminal set to 115200 Baud, 8 data bits, no parity, 1 stop bit. You should select the first COM port assigned to the USB UART Virtual COM port.

3.12 I2C

There are two I2C buses on the P1025, I2C1 and I2C2. I2C1 is intended for Boot Sequencer operation. I2C2 is used for peripherals. [Table 3-7](#) & [Table 3-8](#) list the I2C devices attached to each bus.

Table 3-7. I2C1 Connectivity

Address	Device
0x50	M24256-BWDW6TP 2K EEPROM (16-bit address)

Table 3-8. I2C2 Connectivity

Address	Device
0x1C	MMA8451Q 3 Axis accelerometer
0x23	GPIO expander
0x52	AT24C01B 1K Board EEPROM (8-bit address)
TBD	Primary elevator
TBD	miniPCIe Slot

3.13 SPI

The P1025 SPI is used to control the optional 50 MHz VXCO (DNP by default) and is also routed to the tower primary elevator.

3.14 DDR3

512 MBytes of memory is connected to the P1025 32-bit DDR3 controller. The 512 MByte comprises of two 128 Mbit x 32 bits x 8 banks (2-Gbit) devices (Micron MT41J128M16HA-125G).

The DDR3-SDRAM is configured with 14 row address lines, 10 column address lines, and 8 banks. Control of each memory device is through the CS0 signal. Individual differential clocks and their associated enable signal are routed to each memory.

Every DDR3 signal can be considered to be a member of one of four separate groups. Each group has unique rules in terms of signal connection and signal routing. The four groups and connectivity between controller and Memory are shown in [Table 3-9](#).

Table 3-9. DDR3 Signals

Signal Group	P1 Signal	DDR3 Device 1 Signal	DDR3 Device 2 Signal	Termination/ Notes	Description

Chapter 6

Tower Elevator Connections

6.1 Overview

The TWR-P1025 features two expansion card-edge connectors that interface to the primary and secondary elevator boards in a Tower system. The Primary Connector (comprised of sides A and B) is utilized by the TWR-P1025 while the Secondary Connector (comprised of sides C and D) makes connections to the the SER3 & 7 Serial ports as well as ENET5 RMI and three SERDES lanes. Table 14 provides the pinout for the Primary Connector. Table 15 provides the pinout for the Secondary Connector.

Table 6-1. TWR-P1025 Primary Connector Pinout

Appendix A

Revision History

This appendix provides a list of the major differences between current *TWR-P1025 hardware user guide* and its previous revisions.

A.1 Version Number 2

Updated section 1.5 QorIQ P1025 Device Notification.

A.2 Version Number 1

Added section 1.5 QorIQ P1025 Device Notification.

Updated Table 3.4 CPU Speed Selection.

Updated Table 4.1 P1025 Jumper Table.

A.3 Version Number 0

This is initial version of the TWR-P1025 Hardware User Guide.
