

# MIC37122 Evaluation Board

High-Performance, 1A, Low-Noise,  
Low Dropout Regulator

## General Description

The MIC37122 is a high-performance low-noise, low dropout regulator. The MIC37122 is capable of sourcing 1A output current and offers high-PSRR and low output noise, which makes the IC an ideal general purpose LDO regulator for consumer applications such as set-top boxes and gaming consoles.

The MIC37122 offers 2.5% accuracy, dropout of less than 400mV at 1A, and low ground current (typically 250 $\mu$ A). The MIC37122 can also be put into zero-off-mode current state, drawing little current when disabled. Additionally, an output load discharge feature allows the MIC37122 to discharge large capacitive loads through a low impedance path to ground upon disabling the LDO regulator.

The MIC37122 has an operating junction temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  and is available in lead-free (RoHS-compliant) SOIC-8 and 2.0mm  $\times$  2.0mm MLF<sup>®</sup> packages. The MLF<sup>®</sup> package occupies only 4mm<sup>2</sup> of PCB area, an 86% reduction in board area compared to SOIC-8 packaging.

Datasheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

## Requirements

The MIC37122 evaluation board requires a single input power supply. The  $V_{\text{IN}}$  power supply must be able to deliver 2.375V to 5.5V with more than 1A capability. The output load can either be an active or passive load.

## Precautions

The evaluation board does not have reverse polarity protection. Applying a negative voltage to the  $V_{\text{IN}}$  terminal may damage the device. Additionally, the maximum  $V_{\text{IN}}$  operating voltage of the MIC37122 evaluation board is 5.5V. Exceeding 5.5V on  $V_{\text{IN}}$  could permanently damage the device.

## Getting Started

1. **Connect an external supply to  $V_{\text{IN}}$  terminal.** Apply desired input voltage to the  $V_{\text{IN}}$  and ground (GND) terminals of the evaluation board, paying careful attention to polarity and supply voltage. An ammeter may be placed between the input supply and the  $V_{\text{IN}}$  terminal to the evaluation board. Ensure that the supply voltage is monitored at the  $V_{\text{IN}}$  terminal. The ammeter and/or power lead resistance can reduce the voltage supplied to the input.
2. **Connect the load to the  $V_{\text{OUT}}$  and GND terminals.** The load can be either passive (resistive) or active (as in an electronic load). An ammeter can be placed between the load and the  $V_{\text{OUT}}$  terminal. Ensure that the output voltage is monitored at the  $V_{\text{OUT}}$  terminal. The  $V_{\text{OUT}}$  can be adjusted by changing the feedback resistors (see *Output Voltage* section in this data sheet).
3. **Enable the MIC37122.** The enable (EN) pin is provided on the evaluation board with a 10k pull-up resistor. The output of the MIC37122 may be turned off by shorting the EN pin to ground. An external connection on the board provides easy access to the EN pin. Removing the pull-up resistor and leaving the EN pin floating will cause the regulator to operate in an indeterminate state.

## Output Voltage

The output voltage on the MIC37122 evaluation board is adjustable. The output is set by adjusting the feedback resistors (R1 and R2) and can be calculated as follows:

$$V_{\text{OUT}} = V_{\text{REF}} \times \left( 1 + \frac{R1}{R2} \right)$$

With  $V_{\text{REF}} = 1.0\text{V}$ :

$$R2 = \frac{R1}{V_{\text{OUT}} - 1.0\text{V}}$$
