1 Introduction

This user manual describes the operation of the IQS213EV03 Evaluation Kit. The EV-Kit is manufactured in five parts, consisting of the mainboard device, and four separate swipe plug-in module boards. To visualise raw data from the EV-Kit, the main board can be interfaced to any personal computer with USB support, and IQS213 software GUI. The purpose of the IQS213EV03 EV-Kit is to help application and development engineers in evaluating the IQS213 proximity, touch and swipe sensor, in both self-capacitance and projected capacitance modes.

Figure 2.1 IQS213EV03 EV-Kit

- Used in Data Streaming Mode: EV-KIT requires Mini-USB cable
- Powered by supplied battery, or by Mini-USB cable

2 Standalone/Datastreaming EV-Kit

Figure 2.1 illustrates the evaluation kit mainboard and a plug-in swipe module board. Simply plug in the desired swipe module board and turn on the power switch, as depicted in Figure 2.2

Features included in the IQS213EV03:

- Modular design: Connect one of the supplied plug-in modules into the mainboard, to evaluate and compare swipe performance
- Reference designs for IQS213 with user proximity, touch and swipe detection ability
- Four separate module boards to evaluate 2 or 3 channel swipe operation, in either projected capacitance mode, or self-capacitance mode

Figure 2.2 IQS213EV03 EV-Kit and Plug-in Module

3 Standalone operation

3.1 Powering on the device

Figure 3.1 illustrates the top view of IQS213EV03 EV-KIT

- Ensure desired swipe module is plugged in (swipe module are hot-swappable once the device is powered on)
- Power on the device by using the slide switch as indicated in figure 3.1

Figure 3.1 IQS213EV03 after power on (top view)

After the device is powered by means of the On/Off slide switch, the system calibrates itself and displays information by means of indicator LEDs.

The power indicator LED lights up in green to indicate the system is powered up. The system automatically detects which swipe module is plugged in and displays this information as illustrated in Figure 3.1.

The Swipe Engine Mode is displayed in the upper left corner by means of three indicator LEDs (please see the IQS213 datasheets for information on configuring the Swipe Engine Mode).

3.2 Device operation

- Slide over the SwipeSwitch™ from left to right, or from right to left to bring the device out of standby mode

The Swipe Active indicator will light up as illustrated in Figure 3.2.

Figure 3.2 IQS213EV03 Swipe Active Indicator

In active mode the device will indicate touch detection on each corresponding channel by means of the touch detection indicator LEDs as illustrated in Figure 3.3.

Figure 3.3 Swipe Mode Active

The swipe direction will be indicated by the swipe direction indicator LEDs as depicted in Figure 3.3.

When the swipe is completed the corresponding LED (left or right), will pulse once and turn off again indicating a successful swipe detection.

4 Datastreaming Operation

For operation in data streaming mode, it is necessary to interface the IQS213EV03 EV-Kit to a personal computer by means of a Mini-

USB cable. The IQS213 GUI software is used to stream and visualize data from the IQS213EV03 EV-Kit in real-time.

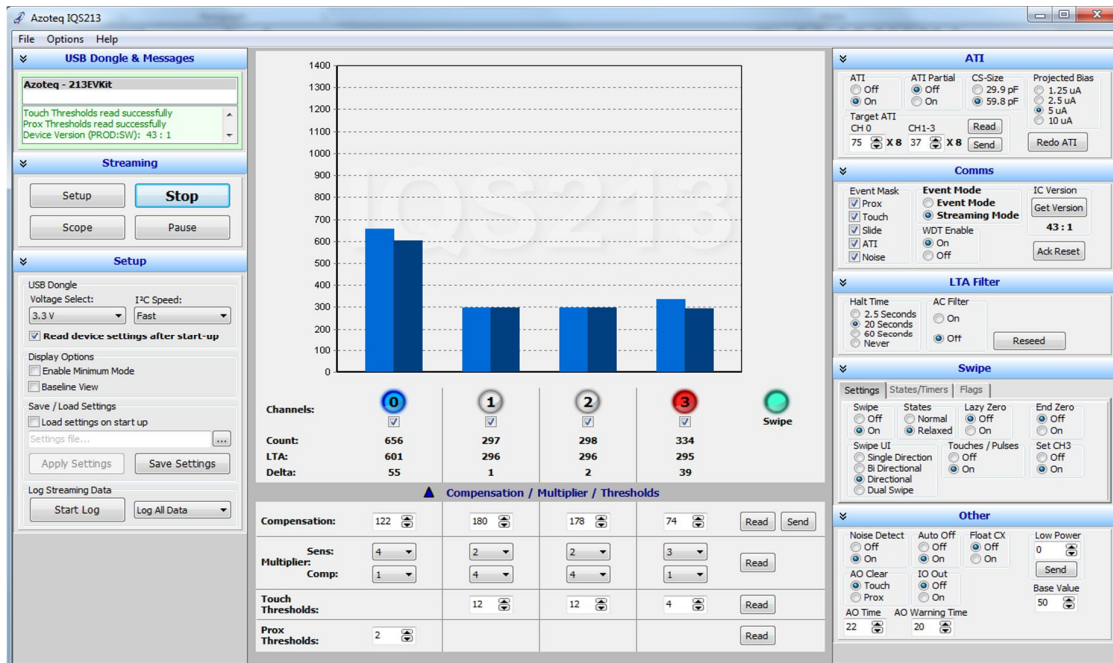

Figure 4.1 IQS213 Graphical User Interface

The IQS213 Software GUI is available from the Azoteq website at www.azoteq.com.

- Install the IQS213 GUI software
- Plug in the desired module into the Mainboard
- Connect the Mainboard to a personal computer with Mini-USB cable
- Run the IQS213 Software GUI and Click on “Start”

The GUI display is illustrated in Figure 3.3 where channel 3 shows a valid touch, and proximity is detected on all other channels.

Important Note: The IQS213 GUI User Guide contains additional information and operating instructions and is available for download at www.azoteq.com.
