

Description and Applications

The ZXGD3005E6 is a high-speed non-inverting single gate driver capable of driving up to 10A into a MOSFET or IGBT gate capacitive load from supply voltages up to 25V. With propagation delay times down to <10ns and correspondingly rise/fall times of <20ns.

This gate driver ensures rapid switching of the MOSFET or IGBT to minimize power losses and distortion in high current switching applications. It is ideally suited to act as a voltage buffer between the typically high output impedances of a controller IC and the effectively low impedance on the gate of a power MOSFET or IGBT during switching. Its low input voltage requirement and high current gain allows high current driving from low voltage controller ICs.

The ZXGD3005E6 has separate source and sink outputs that enables the turn-on and turn-off times of the MOSFET or IGBT to be independently controlled. In addition, the wide supply voltage range allows full enhancement of the MOSFET or IGBT to minimize on-state losses and permits +15V to -5V gate drive voltage to prevent dV/dt induced false triggering of IGBTs. The ZXGD3005E6 has been designed to be inherently rugged to latch-up and shoot-through issues. The optimized pin-out SOT26 package eases board layout, enabling reduced parasitic inductance of traces.

Power MOSFET and IGBT Gate Driving in:

- Synchronous switch-mode power supplies
- Power Factor Correction (PFC) in power supplies
- Secondary side synchronous rectification
- Plasma Display Panel power modules
- 1, 2 and 3-phase motor control circuits
- Audio switching amplifier power output stages
- Solar inverters

Pin Name	Pin Function
V _{CC}	Supply voltage high
IN	Driver input pin
V _{EE}	Supply voltage low
SOURCE	Source current output
SINK	Sink current output

Features and Benefits

- Emitter-follower configuration for ultra-fast switching
 - <10ns propagation delay time
 - <20ns rise/fall time
- Non-inverting voltage buffer stage
- Wide supply voltage up to 25V to minimize on-losses
- 10A peak current drive into capacitive loads
- Low input current of 1mA to deliver 4A output current
- Separate source and sink outputs for independent control of rise and fall time
- Optimized pin-out to ease board layout and minimize parasitic inductance of traces
- Rugged design that avoids latch-up or shoot-through issues
- Near - Zero quiescent supply current
- **“Lead-Free”, RoHS Compliant (Note 1)**
- **“Green” Devices (Note 2)**
- **Qualified to AEC-Q101 Standards for High Reliability**

Mechanical Data

- Case: SOT26
- Case material: Molded Plastic. “Green” Molding Compound.
- UL Flammability Rating 94V-0
- Moisture Sensitivity: Level 1 per J-STD-020
- Terminals: Matte Tin Finish
- Weight: 0.018 grams (approximate)

Ordering Information (Note 3)

Product	Marking	Reel size (inches)	Tape width (mm)	Quantity per reel
ZXGD3005E6TA	3005	7	8	3000

- Notes:
1. No purposefully added lead
 2. “Green” devices, Halogen and Antimony Free, Diodes Inc’s “Green” Policy can be found on our website at <http://www.diodes.com>

Marking Information

3005 = Product Type Marking Code

Typical Application Circuit

Maximum Ratings @ $T_A = 25^\circ\text{C}$ unless otherwise specified

Characteristic	Symbol	Value	Unit
Supply voltage, with respect to V_{EE}	V_{CC}	25	V
Input voltage, with respect to V_{EE}	V_{IN}	25	V
Output difference voltage (Source – Sink)	$\Delta V_{(\text{source-sink})}$	± 7.5	V
Peak output current	I_{PK}	± 10	A
Input current	I_{IN}	± 100	mA

Thermal Characteristics @ $T_A = 25^\circ\text{C}$ unless otherwise specified

Characteristic	Symbol	Value	Unit
Power Dissipation (Notes 4 & 5)	P_D	1.1	W
Linear derating factor		8.8	mW/ $^\circ\text{C}$
Thermal Resistance, Junction to Ambient (Notes 4 & 5)	$R_{\theta JA}$	113	$^\circ\text{C}/\text{W}$
Thermal Resistance, Junction to Lead (Note 6)	$R_{\theta JL}$	105	
Operating and Storage Temperature Range	T_J, T_{STG}	-55 to +150	$^\circ\text{C}$

- Notes:
4. For a device surface mounted on 25mm x 25mm x 0.6mm FR4 PCB with high coverage of single sided 1oz copper, in still air conditions; the device is measured when operating in a steady-state condition. The heatsink is split in half with the pin 1 (V_{CC}) and pin 3 (V_{EE}) connected separately to each half.
 5. For device with two active die running at equal power.
 6. Thermal resistance from junction to solder-point at the end of each lead on pin 1 (V_{CC}) and pin 3 (V_{EE}).

Electrical Characteristics @ $T_A = 25^\circ\text{C}$ unless otherwise specified

Characteristic	Symbol	Min	Typ	Max	Unit	Test Condition
Output voltage, high	V_{OH}	-	$V_{CC} - 0.8$	-	V	$V_{IN} = V_{CC}$

Application Notes

Independent control of rise and fall time

An application may require the turn-on (t_{on}) and turn-off (t_{off}) time to be independently controlled, which can be achieved by setting different R_{SOURCE} and R_{SINK} values. With asymmetric R_{SOURCE} and R_{SINK} resistors, then a potential difference will occur between the SOURCE and SINK pins during the switching transition. If the potential difference across the SOURCE and SINK pins is greater than 7.5V, then it could damage the ZXGD3005.

In this circuit example of driving an IGBT, a blocking diode is added in series with R_{SINK} to protect against excess reverse current being induced into the SINK pin.

Circuit example of driving a MOSFET

Application example of gate driving a MOSFET from 0 to 15V with $R_{SOURCE} = R_{SINK} = 0\Omega$

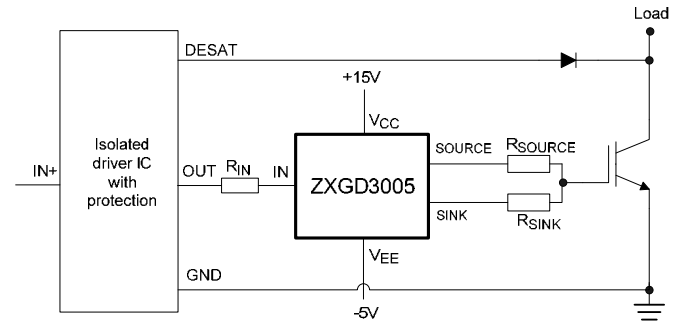

Switching Time Characteristic

Symmetric Source and Sink Resistors

Circuit example of driving an IGBT

Application example of gate driving an IGBT with independent t_{on} and t_{off} using asymmetric R_{SOURCE} and R_{SINK} . In addition, the gate is driven from -5 to +15V to prevent dV/dt induced false triggering.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
