## 1 Introduction

The MCIMX53xA (i.MX53xA) automotive infotainment processor is Freescale Semiconductor's latest addition to a growing family of multimedia-focused products offering high performance processing with a high degree of functional integration aimed at the growing automotive infotainment, telematics, HMI, and display-based cluster markets. This device includes 3D and 2D graphics processors, 1080i/p video processing, and dual display, and provides a variety of interfaces.

The i.MX53xA processor features Freescale's advanced implementation of the ARM™ core, which operates at clock speeds as high as 800 MHz and interfaces with DDR2/LVDDR2-800, LPDDR2-800, or DDR3-800 DRAM memories. This device is well-suited for graphics rendering for HMI and navigation, high performance speech processing with large databases, video processing and display, audio playback, and many other applications.

The flexibility of the i.MX53xA architecture allows for its use in a wide variety of applications. As the heart of the application chipset, the i.MX53xA processor

provides all the interfaces for connecting peripherals, such as WLAN, Bluetooth™, GPS, hard drive, camera sensors, and dual displays.

Features of the i.MX53xA processor include the following:

- **Multilevel memory system**—The multilevel memory system of the i.MX53xA is based on the L1 instruction and data caches, L2 cache, internal and external memory. The i.MX53xA supports many types of external memory devices, including DDR2, low voltage DDR2, LPDDR2, DDR3, NOR Flash, PSRAM, cellular RAM, NAND Flash (MLC and SLC), OneNAND™, and managed NAND including eMMC up to rev 4.4.
- **Smart speed technology**—The i.MX53xA device has power management throughout the IC that enables the rich suite of multimedia features and peripherals to consume minimum power in both active and various low power modes. Smart Speed Technology enables the designer to deliver a feature-rich product requiring levels of power far lower than industry expectations.
- **Multimedia powerhouse**—The multimedia performance of the i.MX53xA processor ARM core is boosted by a multilevel cache system, Neon (including advanced SIMD, 32-bit single-precision floating point support) and vector floating point coprocessors. The system is further enhanced by a multistandard hardware video codec, autonomous image processing unit (IPU), and a programmable smart DMA (SDMA) controller.
- **Powerful graphics acceleration**— The i.MX53xA processors provide two independent, integrated graphics processing units: an OpenGL® ES 2.0 3D graphics accelerator (33 Mtri/s, 200 Mpix/s, and 800 Mpix/s z-plane performance) and an OpenVG™ 1.1 2D graphics accelerator (200 Mpix/s).
- **Interface flexibility**—The i.MX53xA processor supports connection to a variety of interfaces, including LCD controller for two displays and CMOS sensor interface, high-speed USB on-the-go with PHY, plus three high-speed USB hosts, multiple expansion card ports (high-speed MMC/SDIO host and other), 10/100 Ethernet controller, and a variety of other popular interfaces (PATA, UART, I<sup>2</sup>C, and I<sup>2</sup>S serial audio, among others).
- **Automotive environment support**—Includes interfaces such as two CAN ports, an MLB port, an ESAI audio interface, and an asynchronous sample rate converter for multichannel/multisource audio.
- **Advanced security**—The i.MX53xA processors deliver hardware-enabled security features that enable secure e-commerce, digital rights management (DRM), information encryption, secure boot, and secure software downloads. For detailed information about the i.MX53xA security features contact a Freescale representative.

The i.MX53xA application processor is a follow-on to the i.MX51xA, with improved performance, power efficiency, and multimedia capabilities.

## 1.1 Ordering Information

Table 1 provides ordering information.

Table 1. Ordering Information

Part Number	Mask Set	Features		Package <sup>1</sup>
PCIMX536AVV8B	N78C	800 MHz, full feature set	—	19 x 19 mm, 0.8 mm pitch BGA Case TEPBGA-2

<sup>1</sup> Case TEPBGA-2 is RoHS compliant, lead-free MSL (moisture sensitivity level) 3.

## 1.2 Features

The i.MX53xA multimedia applications processor (AP) is based on the ARM Platform, which has the following features:

- MMU, L1 instruction and L1 data cache
- Unified L2 cache
- Target frequency of the core (including Neon, VFPv3 and L1 cache): 800 MHz
- Neon coprocessor (SIMD media processing architecture) and vector floating point (VFP-Lite) coprocessor supporting VFPv3
- TrustZone

The memory system consists of the following components:

- Level 1 cache:
  - Instruction (32 Kbyte)
  - Data (32 Kbyte)
- Level 2 cache:
  - Unified instruction and data (256 Kbyte)
- Level 2 (internal) memory:
  - Boot ROM, including HAB (64 Kbyte)
  - Internal multimedia/shared, fast access RAM (128 Kbyte)
  - Secure/non-secure RAM (16 Kbyte)
- External memory interfaces:
  - 16/32-bit DDR2-800, LV-DDR2-800 or DDR3-800 up to 2 Gbyte
  - 32bit LPDDR2
  - 8/16-bit NAND SLC/MLC Flash, up to 66 MHz, 4/8/14/16-bit ECC
  - 8,16-bit NOR Flash, PSRAM & cellular RAM.
  - 32-bit multiplexed mode NOR Flash, PSRAM & cellular RAM.
  - 8-bit Asynchronous (DTACK mode) EIM interface.

## Introduction

- All EIM pins are muxed on other interfaces (data with NFC pins). I/O muxing logic selects EIM port, as primary muxing at system boot.
- Samsung OneNAND™ and managed NAND including eMMC up to rev 4.4 (in muxed I/O mode)

The i.MX53xA system is built around the following system on chip interfaces:

- 64-bit AMBA AXI v1.0 bus—used by ARM platform, multimedia accelerators (such as VPU, IPU, GPU3D, GPU2D) and the external memory controller (EXTMC) operating at 200 MHz.
- 32-bit AMBA AHB 2.0 bus—used by the rest of the bus master peripherals operating at 133 MHz.
- 32-bit IP bus—peripheral bus used for control (and slow data traffic) of the most system peripheral devices operating at 66 MHz.

The i.MX53xA makes use of dedicated hardware accelerators to achieve state-of-the-art multimedia performance. The use of hardware accelerators provides both high performance and low power consumption while freeing up the CPU core for other tasks.

The i.MX53xA incorporates the following hardware accelerators:

- VPU, version 3—video processing unit
- GPU3D—3D graphics processing unit, OpenGL ES 2.0, version 3, 33 Mtri/s, 200 Mpix/s, and 800 Mpix/s z-plane performance, 256 Kbyte RAM memory
- GPU2D—2D graphics accelerator, OpenVG 1.1, version 1, 200 Mpix/s performance,
- IPU, version 3M—image processing unit
- ASRC—asynchronous sample rate converter

The i.MX53xA includes the following interfaces to external devices:

### NOTE

Not all interfaces are available simultaneously, depending on I/O multiplexer configuration.

- Hard disk drives:
  - SATA, up to U-DMA mode 5, 100 MByte/s
  - SATA I, 1.5 Gbps
- Displays:
  - Five interfaces available. Total rate of all interfaces is up to 180 Mpixels/s, 24 bpp. Up to two interfaces may be active at once.
  - Two parallel 24-bit display ports. The primary port is up to 165 Mpix/s (for example, UXGA @ 60 Hz).
  - LVDS serial ports: one dual channel port up to 165 Mpix/s or two independent single channel ports up to 85 MP/s (for example, WXGA @ 60 Hz) each.
  - TV-out/VGA port up to 150 Mpix/s (for example, 1080p60).
- Camera sensors:
  - Two parallel 20-bit camera ports. Primary up to 180-MHz peak clock frequency, secondary up to 120-MHz peak clock frequency.

- Expansion cards:
  - Four SD/MMC card ports: three supporting 416 Mbps (8-bit i/f) and one enhanced port supporting 832 Mbps (8-bit, eMMC 4.4).
- USB
  - High-speed (HS) USB 2.0 OTG (up to 480 Mbps), with integrated HS USB PHY
  - Three USB 2.0 (480 Mbps) hosts:
    - High-speed host with integrated on-chip high-speed PHY
    - Two high-speed hosts for external HS/FS transceivers through ULPI/serial, support IC-USB
- Automotive environment interfaces:
  - Two controller area network (FlexCAN) interfaces, 1 Mbps each
  - Media local bus or MediaLB (MLB) provides interface to most networks (50 Mbps)
  - Enhanced serial audio interface (ESAI), up to 1.4 Mbps each channel
- Miscellaneous interfaces:
  - One-wire (OWIRE) port
  - Three I2S/SSI/AC97 ports, supporting up to 1.4 Mbps, each connected to audio multiplexer (AUDMUX) providing four external ports.
  - Five UART RS232 ports, up to 4.0 Mbps each. One supports 8-wire, the other four support 4-wire.
  - Two high speed enhanced CSPI (ECSPI) ports plus one CSPI port
  - Three I<sup>2</sup>C ports, supporting 400 kbps
  - Fast Ethernet controller, IEEE1588 V1 compliant, 10/100 Mbps
  - Sony Phillips Digital Interface (SPDIF), Rx and Tx
  - Key pad port (KPP)
  - Two pulse-width modulators (PWM)
  - GPIO with interrupt capabilities
  - Secure JTAG controller (SJC)

The system supports efficient and smart power control and clocking:

- Power gating SRPG (State Retention Power Gating) for ARM core and Neon
- Support for various levels of system power modes
- Flexible clock gating control scheme
- On-chip temperature monitor
- On-chip oscillator amplifier supporting 32.768 kHz external crystal
- On-chip LDO voltage regulators for PLLs

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, and so on)

## Architectural Overview

- Secure JTAG controller (SJC)—Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features
- Secure real-time clock (SRTC)—Tamper resistant RTC with dedicated power domain and mechanism to detect voltage and clock glitches
- Real-time integrity checker, version 3 (RTICv3)—RTIC type1, enhanced with SHA-256 engine
- SAHARAv4 Lite—Cryptographic accelerator that includes true random number generator (TRNG)
- Security controller, version 2 (SCCv2)—Improved SCC with AES engine, secure/non-secure RAM and support for multiple keys as well as TZ/non-TZ separation
- Central security unit (CSU)—Enhancement for the IIM (IC Identification Module). CSU is configured during boot by e-fuses, and determines the security level operation mode as well as the TrustZone (TZ) policy
- Advanced High Assurance Boot (A-HAB)—HAB with the next embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization

### NOTE

The actual feature set depends on the part number as described in [Table 1](#). Functions such as video hardware acceleration, 2D and 3D hardware graphics acceleration, and Macrovision™ video copy protection may not be enabled for specific part numbers.

## 2 Architectural Overview

The following subsections provide an architectural overview of the i.MX53xA processor system.

## 2.1 Block Diagram

Figure 1 shows the functional modules in the i.MX53xA processor system.

### NOTE

The numbers in brackets indicate number of module instances. For example, PWM (2) indicates two separate PWM peripherals.

### 3 Modules List

The i.MX53xA processor contains a variety of digital and analog modules. [Table 2](#) describes these modules in alphabetical order.

**Table 2. i.MX53xA Digital and Analog Blocks**

Block Mnemonic	Block Name	Subsystem	Brief Description
ARM	ARM Platform	ARM	The ARM Cortex A8™ Platform consists of the ARM processor version r2p5 (with TrustZone) and its essential sub-blocks. It contains the 32 Kbyte L1 instruction cache, 32 Kbyte L1 data cache, Level 2 cache controller and a 256 Kbyte L2 cache. The platform also contains an event monitor and debug modules. It also has a NEON coprocessor with SIMD media processing architecture, a register file with 32/64-bit general-purpose registers, an integer execute pipeline (ALU, Shift, MAC), dual single-precision floating point execute pipelines (FADD, FMUL), a load/store and permute pipeline and a non-pipelined vector floating point (VFP Lite) coprocessor supporting VFPv3.
ASRC	Asynchronous Sample Rate Converter	Multimedia Peripherals	The asynchronous sample rate converter (ASRC) converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. The ASRC supports concurrent sample rate conversion of up to 10 channels of about –120 dB THD+N. The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. The ASRC supports up to three sampling rate pairs.
AUDMUX	Digital Audio Multiplexer	Multimedia Peripherals	The AUDMUX is a programmable interconnect for voice, audio, and synchronous data routing between host serial interfaces (for example, SSI1, SSI2, and SSI3) and peripheral serial interfaces (audio and voice codecs). The AUDMUX has seven ports (three internal and four external) with identical functionality and programming models. A desired connectivity is achieved by configuring two or more AUDMUX ports.
CAMP-1 CAMP-2	Clock Amplifier	Clocks, Resets, and Power Control	Clock amplifier
CCM GPC SRC	Clock Control Module Global Power Controller System Reset Controller	Clocks, Resets, and Power Control	These modules are responsible for clock and reset distribution in the system, as well as for system power management. The system includes four PLLs.
CSPI ECSPI-1 ECSPI-2	Configurable SPI, Enhanced CSPI	Connectivity Peripherals	Full-duplex enhanced synchronous serial interface, with data rates 16-60 Mbit/s. It is configurable to support master/slave modes. In Master mode it supports four slave selects for multiple peripherals.
CSU	Central Security Unit	Security	The central security unit (CSU) is responsible for setting comprehensive security policy within the i.MX53xA platform, and for sharing security information between the various security modules. The security control registers (SCR) of the CSU are set during boot time by the high assurance boot (HAB) code and are locked to prevent further writing.

Table 2. i.MX53xA Digital and Analog Blocks (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
DEBUG	Debug System	System Control	<p>The debug system provides real-time trace debug capability of both instructions and data. It supports a trace protocol that is an integral part of the ARM Real Time Debug solution (RealView).</p> <p>Real-time tracing is controlled by specifying a set of triggering and filtering resources, which include address and data comparators, three cross-system triggers (CTI), counters, and sequencers.</p> <p>debug access port (DAP) —The DAP provides real-time access for the debugger without halting the core to system memory, peripheral register, debug configuration registers and JTAG scan chains.</p>
EXTMC	External Memory Controller	Connectivity Peripherals	<p>The EXTMC is an external and internal memory interface. It performs arbitration between multi-AXI masters to multi-memory controllers, divided into four major channels, fast memories (DDR2/DDR3/LPDDR2) channel, slow memories (NOR-FLASH / PSRAM / NAND-FLASH etc.) channel, internal memory (RAM, ROM) channel and graphical memory (GMEM) channel.</p> <p>In order to increase the bandwidth performance, the EXTMC separates the buffering and the arbitration between different channels so parallel accesses can occur. By separating the channels, slow accesses do not interfere with fast accesses.</p> <p>EXTMC Features:</p> <ul style="list-style-type: none"> <li>• 64-bit and 32-bit AXI ports</li> <li>• Enhanced arbitration scheme for fast channel, including dynamic master priority, and taking into account which pages are open or closed and what type (read or write) was the last access</li> <li>• Flexible bank interleaving</li> <li>• Support 16/32-bit DDR2-800 or DDR3-800 or LPDDR2.</li> <li>• Support up to 2 GByte DDR memories.</li> <li>• Support NFC, EIM signal muxing scheme.</li> <li>• Support 8/16/32-bit Nor-Flash/PSRAM memories (sync and async operating modes), at slow frequency. (8-bit is not supported on D[23]-D[16]).</li> <li>• Support 4/8/14/16-bit ECC, page sizes of 512-B, 2-KB and 4-KB Nand-Flash (including MLC)</li> <li>• Multiple chip selects (up to 4).</li> <li>• Enhanced DDR memory controller, supporting access latency hiding</li> <li>• Support watermark for security (internal and external memories)</li> </ul>
EPIT-1 EPIT-2	Enhanced Periodic Interrupt Timer	Timer Peripherals	<p>Each EPIT is a 32-bit “set and forget” timer that starts counting after the EPIT is enabled by software. It is capable of providing precise interrupts at regular intervals with minimal processor intervention. It has a 12-bit prescaler for division of input clock frequency to get the required time setting for the interrupts to occur, and counter values can be programmed on the fly.</p>
ESAI	Enhanced Serial Audio Interface	Connectivity Peripherals	<p>The enhanced serial audio interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors.</p> <p>The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator.</p> <p>The ESAI has 12 pins for data and clocking connection to external devices.</p>

**Table 2. i.MX53xA Digital and Analog Blocks (continued)**

Block Mnemonic	Block Name	Subsystem	Brief Description
ESDHCV3-3	Ultra-High-Speed eMMC / SD Host Controller	Connectivity Peripherals	Ultra high-speed eMMC / SD host controller, enhanced to support eMMC 4.4 standard specification, for 832 MBps. <ul style="list-style-type: none"> <li>Port 3 is specifically enhanced to support eMMC 4.4 specification, for double data rate (832 Mbps, 8-bit port).</li> </ul> ESDHCV3 is backward compatible to ESDHCV2 and supports all the features of ESDHCV2 as described below.
ESDHCV2-1 ESDHCV2-2 ESDHCv2-4	Enhanced Multi-Media Card / Secure Digital Host Controller		Enhanced multimedia card / secure digital host controller <ul style="list-style-type: none"> <li>Ports 1, 2, and 4 are compatible with the “MMC System Specification” version 4.3, full support and supporting 1, 4 or 8-bit data.</li> </ul> The generic features of the eSDHCv2 module, when serving as SD / MMC host, include the following: <ul style="list-style-type: none"> <li>Can be configured either as SD / MMC controller</li> <li>Supports eSD and eMMC standard, for SD/MMC embedded type cards</li> <li>Conforms to SD Host Controller Standard Specification, version 2.0, full support.</li> <li>Compatible with the SD Memory Card Specification, version 1.1</li> <li>Compatible with the SDIO Card Specification, version 1.2</li> <li>Designed to work with SD memory, miniSD memory, SDIO, miniSDIO, SD Combo, MMC and MMC RS cards</li> <li>Configurable to work in one of the following modes:                             <ul style="list-style-type: none"> <li>SD/SDIO 1-bit, 4-bit</li> <li>MMC 1-bit, 4-bit, 8-bit</li> </ul> </li> <li>Full/high speed mode.</li> <li>Host clock frequency variable between 32 kHz to 52 MHz</li> <li>Up to 200 Mbps data transfer for SD/SDIO cards using 4 parallel data lines</li> <li>Up to 416 Mbps data transfer for MMC cards using 8 parallel data lines</li> </ul>
FEC	Fast Ethernet Controller	Connectivity Peripherals	The Ethernet media access controller (MAC) is designed to support both 10 Mbps and 100 Mbps Ethernet/IEEE Std 802.3™ networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The i.MX53xA also consists of HW assist for IEEE1588™ standard. See, TSU and CE_RTC (IEEE1588) section for more details.
FIRI	Fast Infrared Interface	Connectivity Peripherals	Fast infrared interface
FLEXCAN-1 FLEXCAN-2	Flexible Controller Area Network	Connectivity Peripherals	The controller area network (CAN) protocol was primarily, but not exclusively, designed to be used as a vehicle serial data bus. Meets the following specific requirements of this application: real-time processing, reliable operation in the EXTMC environment of a vehicle, cost-effectiveness and required bandwidth. The FLEXCAN is a full implementation of the CAN protocol specification, Version 2.0 B (ISO 11898), which supports both standard and extended message frames at 1 Mbps.

Table 2. i.MX53xA Digital and Analog Blocks (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
GPIO-1 GPIO-2 GPIO-3 GPIO-4 GPIO-5 GPIO-6 GPIO-7	General Purpose I/O Modules	System Control Peripherals	These modules are used for general purpose input/output to external ICs. Each GPIO module supports up to 32 bits of I/O.
GPT	General Purpose Timer	Timer Peripherals	Each GPT is a 32-bit “free-running” or “set and forget” mode timer with a programmable prescaler and compare and capture register. A timer counter value can be captured using an external event, and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in “set and forget” mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock.
GPU3D	Graphics Processing Unit	Multimedia Peripherals	The GPU, version 3, provides hardware acceleration for 2D and 3D graphics algorithms with sufficient processor power to run desk-top quality interactive graphics applications on displays up to HD1080 resolution. It supports color representation up to 32 bits per pixel. GPU enables high-performance mobile 3D and 2D vector graphics at rates up to 33 Mtriangles/s, 200 Mpix/s, 800 Mpix/s (z).
GPU2D	Graphics Processing Unit-2D	Multimedia Peripherals	The GPU2D version 1, provides hardware acceleration for 2D graphic algorithms with sufficient processor power to run desk-top quality interactive graphics applications on displays up to HD1080 resolution.
I2C-1 I2C-2 I2C-3	I <sup>2</sup> C Controller	Connectivity Peripherals	I <sup>2</sup> C provides serial interface for controlling peripheral devices. Data rates of up to 400 kbps are supported.
IIM	IC Identification Module	Security	<p>The IC identification module (IIM) provides an interface for reading, programming, and/or overriding identification and control information stored in on-chip fuse elements. The module supports electrically programmable poly fuses (e-Fuses). The IIM also provides a set of volatile software-accessible signals that can be used for software control of hardware elements not requiring non-volatility. The IIM provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, JTAG secure mode, boot characteristics, and various control signals requiring permanent non-volatility. The IIM also provides up to 28 volatile control signals. The IIM consists of a master controller, a software fuse value shadow cache, and a set of registers to hold the values of signals visible outside the module.</p> <p>IIM interfaces to the electrical fuse array (split to banks). Enables to set up boot modes, security levels, security keys and many other system parameters.</p> <p>i.MX53A consists of 4 x 256-bit + 1x 128-bit fuse-banks (total 1152 bits) through IIM interface.</p>

**Table 2. i.MX53xA Digital and Analog Blocks (continued)**

Block Mnemonic	Block Name	Subsystem	Brief Description
IOMUXC	IOMUX Control	System Control Peripherals	This module enables flexible I/O multiplexing. Each I/O pad has default as well as several alternate functions. The alternate functions are software configurable.
IPU	Image Processing Unit	Multimedia Peripherals	Version 3M IPU enables connectivity to displays, relevant processing and synchronization. It supports two display ports and two camera ports, through the following interfaces: <ul style="list-style-type: none"> <li>• Legacy parallel interfaces</li> <li>• Single/dual channel LVDS display interface</li> <li>• Analog TV or VGA interfaces</li> </ul> The processing includes: <ul style="list-style-type: none"> <li>• Image enhancement—color adjustment and gamut mapping, gamma correction and contrast enhancement</li> <li>• Video/graphics combining</li> <li>• Support for display backlight reduction</li> <li>• Image conversion—resizing, rotation, inversion and color space conversion</li> <li>• Hardware de-interlacing support</li> <li>• Synchronization and control capabilities, allowing autonomous operation.</li> </ul>
KPP	Keypad Port	Connectivity Peripherals	The KPP supports an 8 × 8 external keypad matrix. The KPP features are as follows: <ul style="list-style-type: none"> <li>• Open drain design</li> <li>• Glitch suppression circuit design</li> <li>• Multiple keys detection</li> <li>• Standby key press detection</li> </ul>
LDB	LVDS Display Bridge	Connectivity Peripherals	LVDS display bridge is used to connect the IPU (image processing unit) to external LVDS display interface. LDB supports two channels; each channel has following signals: <ul style="list-style-type: none"> <li>• 1 clock pair</li> <li>• 4 data pairs</li> </ul> On-chip differential drivers are provided for each pair.
MLB	Media local bus—MediaLB	Connectivity/Multimedia Peripherals	The MLB interface module provides a link to a MOST <sup>®</sup> data network, using the standardize MediaLB protocol (up to 50 Mbps).
OWIRE	One-Wire Interface	Connectivity Peripherals	One-wire support provided for interfacing with an on-board EEPROM, and smart battery interfaces, for example, Dallas DS2502.
PATA	Parallel ATA	Connectivity Peripherals	The PATA block is a AT attachment host interface. Its main use is to interface with hard disk drives and optical disc drives. It interfaces with the ATA-6 compliant device over a number of ATA signals. It is possible to connect a bus buffer between the host side and the device side.
PWM-1 PWM-2	Pulse Width Modulation	Connectivity Peripherals	The pulse-width modulator (PWM) has a 16-bit counter and is optimized to generate sound from stored sample audio images. It can also generate tones. The PWM uses 16-bit resolution and a 4 x 16 data FIFO to generate sound.

Table 2. i.MX53xA Digital and Analog Blocks (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
INTRAM	Internal RAM	Internal Memory	Internal RAM, shared with VPU. The on-chip memory controller (OCRAM) module, is an interface between the system's AXI bus, to the internal (on-chip) SRAM memory module. It is used for controlling the 128 KB multimedia RAM, through a 64-bit AXI bus.
BOOTROM	Boot ROM	Internal Memory	Supports secure and regular boot modes. The ROM controller supports ROM patching.
RTIC	Real Time Integrity Checker	Security	Protecting read only data from modification is one of the basic elements in trusted platforms. The run-time integrity checker, version 3 (RTIC) block is a data-monitoring device responsible for ensuring that the memory content is not corrupted during program execution. The RTIC mechanism periodically checks the integrity of code or data sections during normal OS run-time execution without interfering with normal operation. The purpose of the RTIC is to ensure the integrity of the peripheral memory contents, protect against unauthorized external memory elements replacement and assist with boot authentication.
SAHARA	SAHARA Security Accelerator	Security	SAHARA (symmetric/asymmetric hashing and random accelerator), version 4, is a security coprocessor. It implements symmetric encryption algorithms, (AES, DES, 3DES, RC4 and C2), public key algorithms (RSA and ECC), hashing algorithms (MD5, SHA-1, SHA-224 and SHA-256), and a hardware true random number generator. It has a slave IP Bus interface for the host to write configuration and command information, and to read status information. It also has a DMA controller, with an AHB bus interface, to reduce the burden on the host to move the required data to and from memory.
SATA	Serial ATA	Connectivity Peripherals	SATA HDD interface, includes the SATA controller and the PHY. It is a complete mixed-signal IP solution for SATA HDD connectivity.
SCCv2	Security Controller, ver. 2	Security	The security controller is a security assurance hardware module designed to safely hold sensitive data, such as encryption keys, digital right management (DRM) keys, passwords and biometrics reference data. The SCCv2 monitors the system's alert signal to determine if the data paths to and from it are secure, that is, it cannot be accessed from outside of the defined security perimeter. If not, it erases all sensitive data on its internal RAM. The SCCv2 also features a key encryption module (KEM) that allows non-volatile (external memory) storage of any sensitive data that is temporarily not in use. The KEM utilizes a device-specific hidden secret key and a symmetric cryptographic algorithm to transform the sensitive data into encrypted data.

Block Mnemonic	Block Name	Subsystem	Brief Description
SDMA	Smart Direct Memory Access	System Control Peripherals	<p>The SDMA is multi-channel flexible DMA engine. It helps in maximizing system performance by off loading various cores in dynamic data routing. The SDMA features list is as follows:</p> <ul style="list-style-type: none"> <li>• Powered by a 16-bit instruction-set micro-RISC engine</li> <li>• Multi-channel DMA supports up to 32 time-division multiplexed DMA channels</li> <li>• 48 events with total flexibility to trigger any combination of channels</li> <li>• Memory accesses including linear, FIFO, and 2D addressing</li> <li>• Shared peripherals between ARM and SDMA</li> <li>• Very fast context-switching with two-level priority-based preemptive multi-tasking</li> <li>• DMA units with auto-flush and prefetch capability</li> <li>• Flexible address management for DMA transfers (increment, decrement, and no address changes on source and destination address)</li> <li>• DMA ports can handle unidirectional and bidirectional flows (copy mode)</li> <li>• Up to 8-word buffer for configurable burst transfers to / from the EXTMC</li> <li>• Support of byte swapping and CRC calculations</li> <li>• A library of scripts and API is available</li> </ul>
SECRAM	Secure / Non-secure RAM	Internal Memory	Secure / non-secure Internal RAM, controlled by SCC.
SJC	Secure JTAG Interface	System Control Peripherals	<p>JTAG manipulation is a known hacker's method of executing unauthorized program code, getting control over secure applications, and running code in privileged modes. The JTAG port provides a debug access to several hardware blocks including the ARM processor and the system bus. The JTAG port must be accessible during platform initial laboratory bring-up, manufacturing tests and troubleshooting, as well as for software debugging by authorized entities. However, in order to properly secure the system, unauthorized JTAG usage should be strictly forbidden. In order to prevent JTAG manipulation while allowing access for manufacturing tests and software debugging, the i.MX53xA processor incorporates a mechanism for regulating JTAG access. SJC provides four different JTAG security modes that can be selected through an e-fuse configuration.</p>
SPBA	Shared Peripheral Bus Arbiter	System Control Peripherals	SPBA (shared peripheral bus arbiter) is a two-to-one IP bus interface (IP bus) arbiter.
SPDIF	Sony Philips Digital Interface	Multimedia Peripherals	A standard digital audio transmission protocol developed jointly by the Sony and Philips corporations. Both transmitter and receiver functionalists are supported.

Table 2. i.MX53xA Digital and Analog Blocks (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
SRTC	Secure Real Time Clock	Security	The SRTC incorporates a special system state retention register (SSRR) that stores system parameters during system shutdown modes. This register and all SRTC counters are powered by dedicated supply rail NVCC_SRTC_POW. The NVCC_SRTC_POW can be energized separately even if all other supply rails are shut down. The power for this block comes from NVCC_SRTC_POW supply. When this supply is driven by the MC13892 power management controller, this block can be power backed up through the coin-cell feature of the MC13892. This register is helpful for storing warm boot parameters. The SSRR also stores the system security state. In case of a security violation, the SSRR mark the event (security violation indication).
SSI-1 SSI-2 SSI-3	I2S/SSI/AC97 Interface	Connectivity Peripherals	The SSI is a full-duplex synchronous interface used on the i.MX53A processor to provide connectivity with off-chip audio peripherals. The SSI interfaces connect internally to the AUDMUX for mapping to external ports. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock/frame sync options. Each SSI has two pairs of 8 x 24 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream, which reduces CPU overhead in use cases where two time slots are being used simultaneously.
IPTP	IEEE1588 Precision Time Protocol	Connectivity Peripherals	The IEEE 1588-2002 (version 1) standard defines a precision time protocol (PTP) - which is a time-transfer protocol that enables synchronization of networks (for example, Ethernet), to a high degree of accuracy and precision. The IEEE1588 hardware assist is composed of the two blocks: time stamp unit and real time clock, which provide the timestamping protocol's functionality, generating and reading the needed timestamps. The hardware-assisted implementation delivers more precise clock synchronization at significantly lower CPU load compared to purely software implementations.
Temperature Monitor	(Part of SATA Block)	System Control Peripherals	The temperature sensor is an internal module to the i.MX53xA that monitors the die temperature. The monitor is capable in generating SW interrupt, or trigger the CCM, to reduce the core operating frequency.
TVE	TV Encoder	Multimedia	The TV encoder, version 2.1 is implemented in conjunction with the image processing unit (IPU) allowing handheld devices to display captured still images and video directly on a TV or LCD projector. It supports composite PAL/NTSC, VGA, S-video, and component up to HD1080p analog video outputs.
TZIC	TrustZone Aware Interrupt Controller	ARM/Control	The TrustZone interrupt controller (TZIC) collects interrupt requests from all i.MX53xA sources and routes them to the ARM core. Each interrupt can be configured as a normal or a secure interrupt. Software Force Registers and software Priority Masking are also supported.

UART-1 UART-2 UART-3 UART-4 UART-5	UART Interface	Connectivity Peripherals	Each of the UART blocks supports the following serial data transmit/receive protocols and configurations: <ul style="list-style-type: none"> <li>• 7 or 8-bit data words, 1 or 2 stop bits, programmable parity (even, odd, or none)</li> <li>• Programmable bit-rates up to 4 Mbps. This is a higher max baud rate relative to the 1.875 Mbps, which is specified by the TIA/EIA-232-F standard.</li> <li>• 32-byte FIFO on Tx and 32 half-word FIFO on Rx supporting auto-baud</li> <li>• IrDA 1.0 support (up to SIR speed of 115200 bps)</li> <li>• Option to operate as 8-pins full UART, DCE, or DTE</li> </ul>
USB	USB Controller	Connectivity Peripherals	USB supports USB2.0 480 MHz, and contains: <ul style="list-style-type: none"> <li>• One high-speed OTG sub-block with integrated HS USB PHY</li> <li>• One high-speed host sub-block with integrated HS USB PHY</li> <li>• Two identical high-speed Host modules</li> </ul> The high-speed OTG module, which is internally connected to the HS USB PHY, is equipped with transceiver-less logic to enable on-board USB connectivity without USB transceivers All the USB ports are equipped with standard digital interfaces (ULPI, HS IC-USB) and transceiver-less logic to enable onboard USB connectivity without USB transceivers.
VPU	Video Processing Unit	Multimedia Peripherals	A high-performing video processing unit (VPU) version 3, which covers many SD-level video decoders and SD-level encoders as a multi-standard video codec engine as well as several important video processing such as rotation and mirroring. VPU Features: <ul style="list-style-type: none"> <li>• MPEG-2 decode, Mail-High profile, up to 1080i/p resolution, 40 Mbps bit rate</li> <li>• MPEG4/XviD decode, SP/ASP profile, up to 1080 i/p resolution, 40 Mbps bit rate</li> <li>• H.263 decode, P0/P3 profile, up to 16CIF resolution, 20 Mbps bit rate</li> <li>• Sorenson H.263 decode, 4CIF resolution, 8 Mbps bit rate</li> <li>• H.264 decode, BP/MP/HP profile, up to 1080 i/p resolution, 40 Mbps bit rate</li> <li>• VC1 decode, SP/MP/AP profile, up to 1080 i/p resolution, 40 Mbps bit rate</li> <li>• RV10 decode, 8/9/2010 profile, up to 1080 i/p resolution, 40 Mbps bit rate</li> <li>• DivX decode, 3/4/5/6 profile, up to 1080 i/p resolution, 40 Mbps bit rate</li> <li>• MJPEG decode, Baseline profile, up to 8192 x 8192 resolution, 40 Mpixel/s bit rate for 4:4:4 format</li> <li>• MPEG2<sup>1</sup> encode, Main-Main profile, up to D1 resolution, 15 Mbps bit rate</li> <li>• MPEG4 encode, Simple profile, up to 720p resolution, 12 Mbps bit rate<sup>2</sup></li> <li>• H.263 encode, P0/P3 profile, up to 4CIF resolution, 8 Mbps bit rate<sup>2</sup></li> <li>• H.264 encode, Baseline profile, up to 720p resolution, 14 Mbps bit rate<sup>2</sup></li> <li>• MJPEG encode, Baseline profile, up to 8192 x 8192 resolution, 80 Mpixel/s bit rate for 4:2:2 format</li> </ul>
WDOG-1	Watch Dog	Timer Peripherals	The watch dog timer supports two comparison points during each counting period. Each of the comparison points is configurable to evoke an interrupt to the ARM core, and a second point evokes an external event on the WDOG line.

Table 2. i.MX53xA Digital and Analog Blocks (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
WDOG-2 (TZ)	Watch Dog (TrustZone)	Timer Peripherals	The TrustZone watchdog (TZ WDOG) timer module protects against TrustZone starvation by providing a method of escaping normal mode and forcing a switch to the TZ mode. TZ starvation is a situation where the normal OS prevents switching to the TZ mode. This situation should be avoided, as it can compromise the system's security. Once the TZ WDOG module is activated, it must be serviced by TZ software on a periodic basis. If servicing does not take place, the timer times out. Upon a time-out, the TZ WDOG asserts a TZ mapped interrupt that forces switching to the TZ mode. If it is still not served, the TZ WDOG asserts a security violation signal to the CSU. The TZ WDOG module cannot be programmed or deactivated by a normal mode SW.
XTALOSC	24 MHz Crystal Oscillator	Clocking	Provides a crystal oscillator amplifier that supports a 24-MHz external crystal
XTALOSC_32K	32.768 KHz Crystal Oscillator I/F	Clocking	Provides a crystal oscillator amplifier that supports a 32.768-kHz external crystal.

<sup>1</sup> Video partially performed in hardware accelerator (70%) and partially in software.

<sup>2</sup> VPU can generate higher bit rate than the maximum specified by the corresponding standard.

### 3.1 Special Signal Considerations

Special signal consideration information is contained in Chapter 1 of i.MX53 System Development User's Guide.

The package contact assignments can be found in [Section 6, "Package Information and Contact Assignments."](#) Signal descriptions are defined in i.MX53xA Reference Manual.

## 4 Electrical Characteristics

This section provides the device and module-level electrical characteristics for the i.MX53xA processor.

### NOTE

This electrical specification is preliminary. These specifications are not fully tested or guaranteed at this early stage of the product life cycle. Finalized specifications will be published after thorough characterization and device qualifications have been completed.

### 4.1 Chip-Level Conditions

This section provides the device-level electrical characteristics for the IC. See [Table 3](#) for a quick reference to the individual tables and sections.

### 4.1.1 Absolute Maximum Ratings

#### CAUTION

Stresses beyond those listed under [Table 4](#) may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under [Table 6](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Table 4. Absolute Maximum Ratings

Parameter Description	Symbol	Min	Max	Unit
Peripheral Core Supply Voltage	VCC	-0.3	1.35	V
ARM Core Supply Voltage	VDDGP	-0.3	1.35	V
Supply Voltage UHVIO	Supplies denoted as I/O Supply	-0.5	3.6	V
Supply Voltage for non UHVIO	Supplies denoted as I/O Supply	-0.5	3.3	V
USB VBUS	VBUS	—	5.25	V
Input voltage on USB_OTG_DP, USB_OTG_DN, USB_H1_DP, USB_H1_DN pins	USB_DP/USB_DN	-0.3	3.63 <sup>1</sup>	V
Input/Output Voltage Range	V <sub>in</sub> /V <sub>out</sub>	-0.5	OVDD +0.3 <sup>2</sup>	V
ESD Damage Immunity:	V <sub>esd</sub>			
Human Body Model (HBM)		—	2000	V
Charge Device Model (CDM)		—	500	
Storage Temperature Range	T <sub>STORAGE</sub>	-40	150	°C

<sup>1</sup> USB\_DN and USB\_DP can tolerate 5 V for up to 24 hours.

<sup>2</sup> The term OVDD in this section refers to the associated supply rail of an input or output. The association is described in [Table 112 on page 159](#). The maximum range can be superseded by the DC tables.

## 4.1.2 Thermal Resistance

Table 5 provides the package thermal resistance data.

**Table 5. Package Thermal Resistance Data**

Rating	Board	Symbol	Value	Unit
Junction to Ambient (natural convection) <sup>1, 2</sup>	Single layer board (1s)	$R_{\theta JA}$	28	°C/W
Junction to Ambient (natural convection) <sup>1, 2, 3</sup>	Four layer board (2s2p)	$R_{\theta JA}$	16	°C/W
Junction to Ambient (@200 ft/min) <sup>1, 3</sup>	Single layer board (1s)	$R_{\theta JMA}$	21	°C/W
Junction to Ambient (@200 ft/min) <sup>1, 3</sup>	Four layer board (2s2p)	$R_{\theta JMA}$	13	°C/W
Junction to Board <sup>4</sup>	—	$R_{\theta JB}$	6	°C/W
Junction to Case <sup>5</sup>	—	$R_{\theta JC}$	4	°C/W
Junction to Package Top (natural convection) <sup>6</sup>	—	$\Psi_{JT}$	4	°C/W

<sup>1</sup> Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

<sup>2</sup> Per JEDEC JESD51-2 with the single layer board horizontal. Board meets JESD51-9 specification.

<sup>3</sup> Per JEDEC JESD51-6 with the board horizontal.

<sup>4</sup> Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

<sup>5</sup> Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

<sup>6</sup> Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

Table 6. i.MX53xA Operating Ranges (continued)

Symbol	Parameter	Minimum <sup>1</sup>	Nominal <sup>2</sup>	Maximum <sup>1</sup>	Unit
VBUS	See Table 4 on page 18 and Table 104 on page 151 for details. Note that this is not a power supply.	—	—	—	—
VDD_REG <sup>10</sup>	Power supply input for the integrated linear regulators	2.37	2.5	2.63	V
VP	SATA PHY core power supply.	1.25	1.3	1.35	V
VPH	SATA PHY I/O supply voltage	2.25	2.5	2.75	V
T <sub>J</sub>	Junction Temperature	−40	105 <sup>11</sup>	125	°C

<sup>1</sup> Voltage at the package power supply contact must be maintained between the minimum and maximum voltages. The design must allow for supply tolerances and system voltage drops.

<sup>2</sup> The nominal values for the supplies indicate the target setpoint for a tolerance no tighter than  $\pm 50$  mV. Use of supplies with a tighter tolerance allows reduction of the setpoint with commensurate power savings.

<sup>3</sup> VDDA and VDDAL1 can be driven by the VDD\_DIG\_PLL internal regulator using external connections. When operating in this configuration, the regulator is still operating at the default 1.2V, as bootup start. This is acceptable for boot modes when connecting any or all of these supplies to the internal on-die LDO regulator.

During bootup initialization, software should increase this regulator voltage to match VCC (1.3V nominal) in order to reduce internal leakage current.

<sup>4</sup> By default, VDD\_DIG\_PLL is driven from internal on-die 1.2 V linear regulator (LDO). In this case, there is no need driving this supply externally. LDO output to VDD\_DIG\_PLL should be configured by software after power-up to 1.3 V output. A bypass capacitor of minimal value 22  $\mu$ F should be connected to this pad in any case whether it is driven internally or externally. Use of the on-chip LDO is preferred. See i.MX53 System Development User's Guide.

<sup>5</sup> By default, the VDD\_ANA\_PLL is driven from internal on-die 1.8 V linear regulator (LDO). In this case there is no need driving this supply externally. A bypass capacitor of minimal value 22  $\mu$ F should be connected to this pad in any case whether it is driven internally or externally. Use of the on-chip LDO is preferred. See i.MX53 System Development User's Guide.

<sup>6</sup> In case the VDD\_FUSE is kept powered on during Fuse Read mode, the efuse\_prog\_supply\_gate bit in CCM\_CGPR register should be kept low, to avoid the possibility of inadvertently blowing fuses. Alternately, VDD\_FUSE can be ground or left floating, when not in Fuse Write mode.

<sup>7</sup> If not using TVE module or other pads in this power domain for the product, the TVDAC\_DHVDD and TVDAC\_AHVDDRGB can remain floating.

<sup>8</sup> GPIO pad operational at low frequency

<sup>9</sup> The analog supplies should be isolated in the application design. Use of series inductors is recommended.

<sup>10</sup> VDD\_REG is power supply input for the integrated linear regulators of VDD\_ANA\_PLL and VDD\_DIG\_PLL when they are configured to the internal supply option. VDDR\_REG still has to be tied to 2.5 V supply when VDD\_ANA\_PLL and VDD\_DIG\_PLL are configured for external power supply mode although in this case it is not used as supply source.

<sup>11</sup> Lifetime of 43,800 hours based on 105 C junction temperature at nominal supply voltages.

#### 4.1.4 External Clock Sources

The i.MX53xA device has four external input system clocks, a low frequency (CKIL), a high frequency (XTAL), and two general purpose CKIH1 and CKIH2 clocks.

The CKIL is used for low-frequency functions. It supplies the clock for wake-up circuit, power-down real time clock operation, and slow system and watch-dog counters. The clock input can be connected to either external oscillator or a crystal using internal oscillator amplifier.

## Electrical Characteristics

The system clock input XTAL is used to generate the main system clock. It supplies the PLLs and other peripherals. The system clock input can be connected to either external oscillator or a crystal using internal oscillator amplifier.

CKIH1 and CKIH2 provide additional clock source option for peripherals that require specific and accurate frequencies.

Table 7 shows the interface frequency requirements.

**Table 7. External Input Clock Frequency**

Parameter Description	Symbol	Min	Typ	Max	Unit
CKIL Oscillator <sup>1</sup>	$f_{ckil}$	—	32.768 <sup>2</sup> /32.0	—	kHz
CKIH1, CKIH2 Operating Frequency	$f_{ckih1}$ , $f_{ckih2}$	See Table 31, "CAMP Electrical Parameters (CKIH1, CKIH2)," on page 44			MHz
XTAL Oscillator	$f_{xtal}$	22	24	27	MHz

<sup>1</sup> External oscillator or a crystal with internal oscillator amplifier.

<sup>2</sup> Recommended nominal frequency 32.768 kHz.

### 4.1.5 Maximal Supply Currents

Table 8 represents the maximal momentary current transients on power lines, and should be used for power supply selection. Maximal currents higher by far than the average power consumption of typical use cases. For typical power consumption information, see i.MX53xA power consumption application note.

## 4.2 Power Supplies Requirements and Restrictions

The system design must comply with power-up sequence, power-down sequence and steady state guidelines as described in this section to guarantee the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the i.MX53xA processor (worst-case scenario)

### 4.2.1 Power-Up Sequence

The following observations should be considered:

- The consequent steps in power up sequence should not start before the previous step supplies have been stabilized within 90-110% of their nominal voltage, unless stated otherwise.

- NVCC\_SRTC\_POW should remain powered ON continuously, to maintain internal real-time clock status. Otherwise, it has to be powered ON together with VCC, or preceding VCC.
- The VCC should be powered ON together, or any time after NVCC\_SRTC\_POW.
- NVCC\_CKIH should be powered ON after VCC is stable and before other IO supplies (NVCC\_XXX) are powered ON.
- IO Supplies (NVCC\_XXX) below or equal to 2.8 V nom./3.1 V max. should not precede NVCC\_CKIH. They can start powering ON during NVCC\_CKIH ramp-up, before it is stabilized. Within this group, the supplies can be powered-up in any order.
- IO Supplies (NVCC\_XXX) above 2.8 V nom./3.1 V max. should be powered ON only after NVCC\_CKIH is stable.
- In case VDD\_DIG\_PLL and VDD\_ANA\_PLL are powered ON from internal voltage regulator (default case for i.MX53), there are no related restrictions on VDD\_REG, as it is used as their internal regulators power source.  
If VDD\_DIG\_PLL and VDD\_ANA\_PLL are powered on externally, to reduce current leakage during the power-up, it is recommended to activate the VDD\_REG before or at the same time with VDD\_DIG\_PLL and VDD\_ANA\_PLL. If this sequencing is not possible, make sure that the 2.5 V VDD\_REG supply shut-off output impedance is higher than 1 kΩ when it is inactive.
- VDD\_REG supply is required to be powered ON to enable DDR operation. It must be powered on after VCC and before NVCC\_EMI\_DRAM. The sequence should be:  
VCC → VDD\_REG → NVCC\_EMI\_DRAM
- VDDA and VDDAL1 can be powered ON anytime before POR\_B, regardless of any other power signal.
- VDDGP can be powered ON anytime before POR\_B, regardless of any other power signal.
- VP and VPH can be powered up together, or anytime after, the VCC. VP and VPH should come before POR.
- TVDAC\_DHVDD and TVDAC\_AHVDDRGB should be powered from the same regulator. This is due to ESD diode protection circuit, that may cause current leakage if one of the supplies is powered ON before the other.

#### NOTE

The POR\_B input must be immediately asserted at power-up and remain asserted until after the last power rail reaches its working voltage.

Figure 2 shows the power-up sequence diagram.

Figure 2. Power Up Detailed Sequence <sup>1</sup>

**NOTE**

Need to ensure that there is no back voltage (leakage) from any supply on the board towards the 3.3 V supply (for example, from the parts that use both 1.8 V and the 3.3 V supply).

1. If fuse writing is required, VDD\_FUSE should be powered ON after NVCC\_CKIH is stable.

## 4.2.2 Power-Down Sequence

Power-down sequence should follow one of the following two options:

**Option 1:** Switch all supplies down simultaneously with further free discharge. A deviation of few microseconds of actual power-down of the different power rails is acceptable.

**Option 2:** Switch down supplies, in any order, keeping the following rules:

- NVCC\_CKIH must be powered down at the same time or after the UHVIO IO cell supplies. A deviation of few microseconds of actual power-down of the different power rails is acceptable.
- VDD\_REG must be powered down at the same time or after NVCC\_EMI\_DRAM supply. A deviation of few microseconds of actual power-down of the different power rails is acceptable.
- If all of the following conditions are met:
  - 1. VDD\_REG is powered down to 0V (Not Hi-Z)
  - 2. VDD\_DIG\_PLL and VDD\_ANA\_PLL are provided externally,
  - 3. VDD\_REG is powered down before VDD\_DIG\_PLL and VDD\_ANA\_PLL

Then the following rule should be kept: VDD\_REG output impedance must be higher than 1 k $\Omega$ , when inactive.

## 4.2.3 Power Supplies Usage

- All IO pins should not be externally driven while the IO power supply for the pin (NVCC\_XXX) is off. This can cause internal latch-up and malfunctions due to reverse current flows. For information about IO power supply of each pin, see “Power Rail” columns in pin list tables of [Section 6, “Package Information and Contact Assignments.”](#)
- If not using SATA interface and the embedded thermal sensor, the VP and VPH should be grounded. In particular, keeping VPH turned OFF while the VP is powered ON is not recommended and might lead to excessive power consumption.
- When internal clock source is used for SATA temperature monitor the USB\_PHY supplies and PLL need to be active because they are providing the clock.
- If not using TVE the module, the TVDAC\_DHVDD and TVDAC\_AHVDDRGB can remain floating. If only the GPIO pads in TVDAC\_AHVDDRGB domain are in use, the supplies can be set to GPIO pad voltage range (1.65 V to 3.1 V).

## 4.3 I/O DC Parameters

This section includes the DC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate 3 I/O (DDR3) for DDR2/LVDDR2, LPDDR2 and DDR3 modes
- Low Voltage I/O (LVIO)
- Ultra High Voltage I/O (UHVIO)
- LVDS I/O

**NOTE**

The term ‘OVDD’ in this section refers to the associated supply rail of an input or output. The association is shown in Table 112.

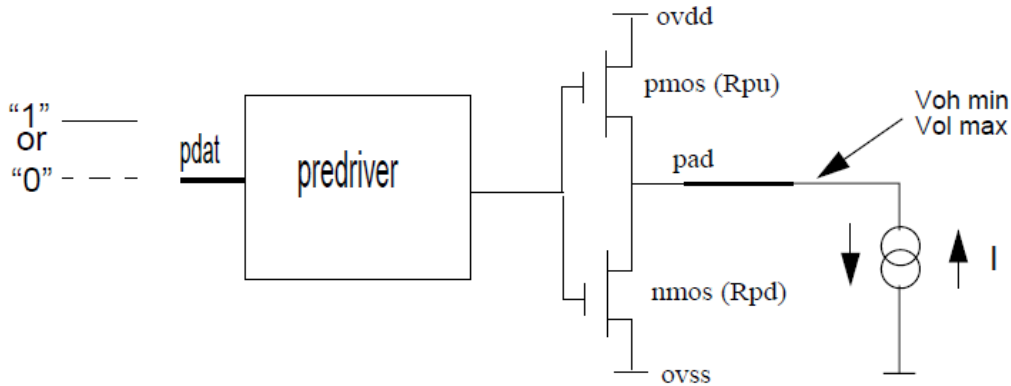

Figure 3. Circuit for Parameters Voh and Vol for IO Cells

**4.3.1 General Purpose I/O (GPIO) DC Parameters**

The parameters in Table 10 are guaranteed per the operating ranges in Table 6, unless otherwise noted. Table 10 shows DC parameters for GPIO pads, operating at two supply ranges:

- 1.1 V to 1.3 V
- 1.65 V to 3.1 V

Table 10. GPIO I/O DC Electrical Characteristics

<sup>1</sup> Overshoot and undershoot conditions (transitions above OVDD and below GND) on switching pads must be held below 0.6 V, and the duration of the overshoot/undershoot must not exceed 10% of the system clock cycle. Overshoot/undershoot must be controlled through printed circuit board layout, transmission line impedance matching, signal line termination, or other methods. Non-compliance to this specification may affect device reliability or cause permanent damage to the device.

<sup>2</sup> To maintain a valid level, the transition edge of the input must sustain a constant slew rate (monotonic) from the current DC level through to the target DC level, V<sub>IL</sub> or V<sub>IH</sub>. Monotonic input transition time is from 0.1 ns to 1 s.

<sup>3</sup> Hysteresis of 250 mV is guaranteed over all operating conditions when hysteresis is enabled.

<sup>4</sup> Use an off-chip pull resistor of less than 60kΩ to override this keeper.

### 4.3.2 LPDDR2 I/O DC Parameters

The LPDDR2 I/O pads support DDR2/LVDDR2, LPDDR2, and DDR3 operational modes.

#### 4.3.2.1 DDR2 Mode I/O DC Parameters

The DDR2 interface fully complies with JESD79-2E DDR2 JEDEC standard release April, 2008. The parameters in [Table 11](#) are guaranteed per the operating ranges in [Table 6](#), unless otherwise noted.

Table 11. DDR2 I/O DC Electrical Parameters<sup>1</sup>

<sup>1</sup> Note that the JEDEC SSTL\_18 specification (JESD8-15a) for a SSTL interface for class II operation supersedes any specification in this document.

<sup>2</sup> OVDD is the I/O power supply (1.7 V–1.9 V for DDR2)

<sup>3</sup> (Vout - OVDD) / Ioh must be less than 21 Ω for values of Vout between OVDD and OVDD-0.28 V.

<sup>4</sup> Vout / Iol must be less than 21 Ω for values of Vout between 0 V and 280 mV.

<sup>5</sup> Vin(dc) specifies the allowable DC voltage exertion of each differential input.

<sup>6</sup> Vid(dc) specifies the input differential voltage |Vtr-Vcpl| required for switching, where Vtr is the “true” input level and Vcpl is the “complementary” input level. The minimum value is equal to Vih(dc) -Vil(dc).

<sup>7</sup> Typ condition: 1.8 V, and 25 °C. Max condition: 1.9 V, and 105 °C.

<sup>8</sup> Use an off-chip pull resistor of less than 60kΩ to override this keeper.

### 4.3.2.2 LPDDR2 Mode I/O DC Parameters

The LPDDR2 interface fully complies with JESD209-2B LPDDR2 JEDEC standard release June, 2009.

<sup>1</sup> Note that the JEDEC LPDDR2 specification (JESD209\_2B) supersedes any specification in this document.

<sup>2</sup> The single-ended signals need to be within the respective limits (Vih(dc) max, Vil(dc) min) for single-ended signals as well as the limitations for overshoot and undershoot.

<sup>3</sup> Use an off-chip pull resistor of less than 60kΩ to override this keeper.

### 4.3.2.3 DDR3 Mode I/O DC Parameters

The DDR3 interface fully complies with JESD79-3D DDR3 JEDEC standard release April, 2008. The parameters in Table 13 are guaranteed per the operating ranges in Table 6, unless otherwise noted.

Table 13. DDR3 I/O DC Electrical Parameters

<sup>1</sup> OVDD – I/O power supply (1.425 V–1.575 V for DDR3)

<sup>2</sup> Vref – DDR3 external reference voltage

## Electrical Characteristics

- <sup>3</sup> The single-ended signals need to be within the respective limits ( $V_{ih}(dc)$  max,  $V_{il}(dc)$  min) for single-ended signals as well as the limitations for overshoot and undershoot.
- <sup>4</sup> Use an off-chip pull resistor of less than 60k $\Omega$  to override this keeper.

### 4.3.3 Low Voltage I/O (LVIO) DC Parameters

The parameters in Table 14 are guaranteed per the operating ranges in Table 6, unless otherwise noted. The LVIO pads operate only as inputs.

**Table 14. LVIO DC Electrical Characteristics**

<sup>1</sup> Overshoot and undershoot conditions (transitions above OVDD and below GND) on switching pads must be held below 0.6 V, and the duration of the overshoot/undershoot must not exceed 10% of the system clock cycle. Overshoot/undershoot must be controlled through printed circuit board layout, transmission line impedance matching, signal line termination, or other methods. Non-compliance to this specification may affect device reliability or cause permanent damage to the device.

<sup>2</sup> To maintain a valid level, the transition edge of the input must sustain a constant slew rate (monotonic) from the current DC level through to the target DC level, VIL or VIH. Monotonic input transition time is from 0.1 ns to 1 s. VIL and VIH do not apply when hysteresis is enabled.

<sup>3</sup> Hysteresis of 350 mV is guaranteed over all operating conditions when hysteresis is enabled.

<sup>4</sup> Use an off-chip pull resistor of less than 60k $\Omega$  to override this keeper.

### 4.3.4 Ultra-High Voltage I/O (UHVIO) DC Parameters

The parameters in Table 15 are guaranteed per the operating ranges in Table 6, unless otherwise noted.

Table 15. UHVIO DC Electrical Characteristics

- <sup>3</sup> Hysteresis of 250 mV is guaranteed over all operating conditions when hysteresis is enabled.

### 4.3.5 LVDS I/O DC Parameters

The LVDS interface complies with TIA/EIA 644-A standard. See TIA/EIA STANDARD 644-A, “Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits” for details.

Table 16 shows the Low Voltage Differential Signaling (LVDS) DC electrical characteristics.

**Table 16. LVDS DC Electrical Characteristics**

DC Electrical Characteristics	Symbol	Test Conditions	Min	Typ	Max	Unit
Output Differential Voltage	$V_{OD}$	Rload=100Ω padP, -padN	250	350	450	mV

## 4.4 Output Buffer Impedance Characteristics

This section defines the I/O Impedance parameters of the i.MX53xA processor for the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate 3 I/O (DDR3) for DDR2/LVDDR2, LPDDR2, and DDR3 modes
- Ultra High Voltage I/O (UHVIO)
- LVDS I/O

### NOTE

Output driver impedance is measured with “long” transmission line of impedance  $Z_{tl}$  attached to I/O pad and incident wave launched into transmission line.  $R_{pu}/R_{pd}$  and  $Z_{tl}$  form a voltage divider that defines specific voltage of incident wave relative to OVDD. Output driver impedance is calculated from this voltage divider (see Figure 4).

$$R_{pu} = \frac{V_{ovdd} - V_{ref1}}{V_{ref1}} \times Z_{tl}$$

$$R_{pd} = \frac{V_{ref2}}{V_{ovdd} - V_{ref2}} \times Z_{tl}$$

Figure 4. Impedance Matching Load for Measurement

### 4.4.1 GPIO Output Buffer Impedance

Table 17 shows the GPIO output buffer impedance.

Table 17. GPIO Output Buffer Impedance

Parameter	Symbol	Test Conditions	Min	Typ		Max	Unit
				OVDD 2.775 V	OVDD 1.875 V

		High Drive Strength, Ztl = 50 Ω	32	40	42	51	60	72	

### 4.4.4 LVDS I/O Output Buffer Impedance

The LVDS interface complies with TIA/EIA 644-A standard. See, TIA/EIA STANDARD 644-A, “Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits” for details.

## 4.5 I/O AC Parameters

This section includes the AC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate 3 I/O (DDR3) for DDR2/LVDDR2, LPDDR2 and DDR3 modes

- Low Voltage I/O (LVIO)
- Ultra High Voltage I/O (UHVIO)
- LVDS I/O

The load circuit and output transition time waveforms are shown in [Figure 5](#) and [Figure 6](#).

<sup>1</sup>  $t_{SKD} = |t_{PHLD} - t_{PLHD}|$ , is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.

<sup>2</sup> Measurement levels are 20-80% from output voltage.

## 4.6 System Modules Timing

This section contains the timing and electrical parameters for the modules in the i.MX53xA processor.

### 4.6.1 Reset Timings Parameters

Figure 8 shows the reset timing and Table 29 lists the timing parameters.

Figure 8. Reset Timing Diagram

Table 29. Reset Timing Parameters

ID	Parameter	Min	Max	Unit
CC1	Duration of RESET_IN to be qualified as valid (input slope = 5 ns)	50	—	ns

### 4.6.2 WDOG Reset Timing Parameters

Figure 9 shows the WDOG reset timing and Table 30 lists the timing parameters.

Figure 9. WATCHDOG\_RST Timing Diagram

Table 30. WATCHDOG\_RST Timing Parameters

ID	Parameter	Min	Max	Unit
CC5	Duration of WATCHDOG_RESET Assertion	1	—	T <sub>CKIL</sub>

**NOTE**

CKIL is approximately 32 kHz. T<sub>CKIL</sub> is one period or approximately 30 μs.

### 4.6.3 Clock Amplifier Parameters (CKIH1, CKIH2)

The input to Clock Amplifier (CAMP) is internally ac-coupled allowing direct interface to a square wave or sinusoidal frequency source. No external series capacitors are required.

Table 31 shows the electrical parameters of CAMP.

Table 31. CAMP Electrical Parameters (CKIH1, CKIH2)

Parameter	Min	Typ	Max	Unit
Input frequency	8.0	—	40.0	MHz
VIL (for square wave input)	0	—	0.3	V
VIH (for square wave input) <sup>1</sup>	NVCC_CKIH – 0.25	—	NVCC_CKIH	V
Sinusoidal input amplitude <sup>2</sup>	0.4	—	VDD	Vp-p
Output duty cycle	45	50	55	%

<sup>1</sup> NVCC\_CKIH is the supply voltage of CAMP.

<sup>2</sup> Minimum value of the sinusoidal input will be determined during characterization.

### 4.6.4 DPLL Electrical Parameters

Table 32 shows the electrical parameters of digital phase-locked loop (DPLL).

Table 32. DPLL Electrical Parameters

Parameter	Test Conditions/Remarks	Min	Typ	Max	Unit
Reference clock frequency range <sup>1</sup>	—	10	—	100	MHz
Reference clock frequency range after pre-divider	—	10	—	40	MHz
Output clock frequency range (dpdck_2)	—	300	—	1025	MHz
Pre-division factor <sup>2</sup>	—	1	—	16	—
Multiplication factor integer part	—	5	—	15	—
Multiplication factor numerator <sup>3</sup>	Should be less than denominator	–67108862	—	67108862	—
Multiplication factor denominator <sup>2</sup>	—	1	—	67108863	—
Output Duty Cycle	—	48.5	50	51.5	%

Table 32. DPLL Electrical Parameters (continued)

Parameter	Test Conditions/Remarks	Min	Typ	Max	Unit
Frequency lock time <sup>4</sup> (FOL mode or non-integer MF)	—	—	—	398	$T_{dpdref}$
Phase lock time	—	—	—	100	$\mu$ s
Frequency jitter <sup>5</sup> (peak value)	—	—	0.02	0.04	$T_{dck}$
Phase jitter (peak value)	FPL mode, integer and fractional MF	—	2.0	3.5	ns
Power dissipation	$f_{dck} = 300$ MHz @ $avdd = 1.8$ V, $dvdd = 1.2$ V $f_{dck} = 650$ MHz @ $avdd = 1.8$ V, $dvdd = 1.2$ V	—	—	0.65 (avdd) 0.92 (dvdd) 1.98 (avdd) 1.8 (dvdd)	mW

<sup>1</sup> Device input range cannot exceed the electrical specifications of the CAMP, see Table 31.

<sup>2</sup> The values specified here are internal to DPLL. Inside the DPLL, a “1” is added to the value specified by the user. Therefore, the user has to enter a value “1” less than the desired value at the inputs of DPLL for PDF and MFD.

<sup>3</sup> The maximum total multiplication factor (MFI + MFN/MFD) allowed is 15. Therefore, if the MFI value is 15, MFN value must be zero.

<sup>4</sup>  $T_{dpdref}$  is the time period of the reference clock after predivider. According to the specification, the maximum lock time in FOL mode is 398 cycles of divided reference clock when DPLL starts after full reset.

<sup>5</sup>  $T_{dck}$  is the time period of the output clock,  $dpdck\_2$ .

## 4.6.5 NAND Flash Controller (NFC) Parameters

This section provides the relative timing requirements among various signals of NFC at the module level, in each operational mode.

Timing parameters in Figure 10, Figure 11, Figure 12, Figure 13, Figure 15, and Table 34 show the default NFC mode (asymmetric mode) using two Flash clock cycles per one access of RE\_B and WE\_B.

Timing parameters in Figure 10, Figure 11, Figure 12, Figure 14, Figure 15, and Table 34 show symmetric NFC mode using one Flash clock cycle per one access of RE\_B and WE\_B.

With reference to the timing diagrams, a high is defined as 80% of signal value and low is defined as 20% of signal value. All parameters are given in nanoseconds. The BGA contact load used in calculations is 20 pF (except for NF16 - 40 pF) and there is maximum drive strength on all contacts.

All timing parameters are a function of T, which is the period of the flash\_clk clock (“enfc\_clk” at system level). This clock frequency can be controlled by the user, configuring CCM (SoC clock controller). The clock is derived from emi\_slow\_clk after single divider.

Table 33 demonstrates several examples of clock frequency settings.

Table 33. NFC Clock Settings Examples

emi_slow_clk (MHz)	nfc_podf (Division Factor)	enfc_clk (MHz)	T-Clock Period (ns)
100 (Boot mode)	7 <sup>1</sup>	14.29	70
	3 <sup>2</sup>	33.33	30

Table 33. NFC Clock Settings Examples (continued)

emi_slow_clk (MHz)	nfc_podf (Division Factor)	enfc_clk (MHz)	T-Clock Period (ns)
133	4	33.33	30
	3	44.33 <sup>3</sup>	22.5
	2	66 <sup>3</sup>	15

<sup>1</sup> Boot value NFC\_FREQ\_SEL Fuse High (burned)

<sup>2</sup> Boot value NFC\_FREQ\_SEL Fuse Low

<sup>3</sup> For RBB\_MODE=1, using NANDF\_RB0 signal for ready/busy indication. This mode require setting the delay line. See the Reference Manual for details.

**NOTE**

A potential limitation for minimum clock frequency may exist for some devices. When the clock frequency is too low, the data bus capturing might occur after the specified  $t_{rthoh}$  (RE\_B high to output hold) period. Setting the clock frequency above 25.6 MHz (that is,  $T = 39$  ns) guaranties a proper operation for devices having  $t_{rthoh} > 15$  ns. It is also recommended that the NFC\_FREQ\_SEL Fuse be set accordingly to initiate the boot with 33.33 MHz clock.

Lower frequency operation can be supported for most available devices in the market, relying on data lines Bus-Keeper logic. This depends on device behavior on the data bus in the time interval between data output valid to data output high-Z state. In NAND device parameters this period is marked between  $t_{rthoh}$  and  $t_{rhz}$  (RE\_B high to output high-Z). In most devices, the data transition from valid value to high-Z occurs without going through other states. Setting the data bus pads to Bus-Keeper mode in the IOMUXC registers, keeps the data bus valid internally after the specified hold time, allowing proper capturing with slower clock.

<sup>1</sup> t<sub>DSR</sub> is calculated by the following formula:

$$\text{Asymmetric mode: } t_{DSR} = t_{REpd} + t_{Dpd} + \frac{1}{2}T - Tdl^2$$

$$\text{Symmetric mode: } t_{DSR} = t_{REpd} + t_{Dpd} - Tdl^2$$

$$t_{REpd} + t_{Dpd} = 11.2 \text{ ns (including clock skew)}$$

where t<sub>REpd</sub> is RE propagation delay in the chip including I/O pad delay, and t<sub>Dpd</sub> is Data propagation delay from I/O pad to EXTMC including I/O pad delay.

t<sub>DSR</sub> can be used to determine t<sub>REA</sub> max parameter with the following formula: t<sub>REA</sub> = 1.5T – t<sub>DSR</sub>.

<sup>2</sup> Tdl is composed of 4 delay-line units each generates an equal delay with min 1.25 ns and max 1 aclk period (T<sub>ack</sub>). Default is 1/4 aclk period for each delay-line unit, so all 4 delay lines together generates a total of 1 aclk period. T<sub>ack</sub> is “emi\_slow\_clk” of the system, which default value is 7.5 ns (133 MHz).

<sup>3</sup> NF17 is defined only in asymmetric operation mode.

NF17 max value is equivalent to max t<sub>RHZ</sub> value that can be used with NFC.

T<sub>ack</sub> is “emi\_slow\_clk” of the system.

## Electrical Characteristics

<sup>4</sup> NF18 is defined only in Symmetric operation mode.

$t_{DHR}$  (MIN) is calculated by the following formula:  $TdI^2 - (t_{REpd} + t_{Dpd})$

where  $t_{REpd}$  is RE propagation delay in the chip including I/O pad delay, and  $t_{Dpd}$  is Data propagation delay from I/O pad to EXTMC including I/O pad delay.

NF18 max value is equivalent to max  $t_{RHZ}$  value that can be used with NFC.

$T_{clk}$  is "emi\_slow\_clk" of the system.

## 4.6.6 External Interface Module (EIM)

The following subsections provide information on the EIM.

### 4.6.6.1 EIM Signal Cross Reference

Table 35 is a guide intended to help the user identify signals in the External Interface Module Chapter of the Reference Manual which are identical to those mentioned in this data sheet.

**Table 35. EIM Signal Cross Reference**

- <sup>1</sup>  $t$  is the maximal EIM logic (axi\_clk) cycle time. The maximum allowed axi\_clk frequency is 133 MHz, whereas the maximum allowed BCLK frequency is 104 MHz. As a result, if BCD = 0, axi\_clk must be  $\leq 104$  MHz. If BCD = 1, then 133 MHz is allowed for axi\_clk, resulting in a BCLK of 66.5 MHz. When the clock branch to EIM is decreased to 104 MHz, other busses are impacted which are clocked from this source. See the CCM chapter of the i.MX53 Reference Manual for a detailed clock tree description.
- <sup>2</sup> BCLK parameters are being measured from the 50% point, that is, high is defined as 50% of signal value and low is defined as 50% of signal value.
- <sup>3</sup> For signal measurements "High" is defined as 80% of signal value and "Low" is defined as 20% of signal value.

#### 4.6.6.4 Examples of EIM Synchronous Accesses

Figure 18 to Figure 21 provide few examples of basic EIM accesses to external memory devices with the timing parameters mentioned previously for specific control parameters settings.

#### 4.6.6.5 General EIM Timing-Asynchronous Mode

Figure 22 through Figure 26, and Table 39 help to determine timing parameters relative to the chip select (CS) state for asynchronous and DTACK EIM accesses with corresponding EIM bit fields and the timing parameters mentioned above.

Asynchronous read & write access length in cycles may vary from what is shown in Figure 22 through Figure 25 as RWSC, OEN & CSN is configured differently. See i.MX53xA RM for the EIM programming model.

#### 4.6.7 DDR SDRAM Specific Parameters (DDR2/LVDDR2, LPDDR2 and DDR3)

The DDR2/LVDDR2 interface fully complies with JESD79-2E – DDR2 JEDEC release April, 2008, supporting DDR2-800 and LVDDR2-800.

The DDR3 interface fully complies with JESD79-3D – DDR3 JEDEC release April 2008 supporting DDR3-800.

The LPDDR2 interface fully complies with JESD209-2B, supporting LPDDR2-800.

## 4.7 External Peripheral Interfaces Parameters

The following subsections provide information on external peripheral interfaces.

### 4.7.1 AUDMUX Timing Parameters

The AUDMUX provides a programmable interconnect logic for voice, audio and data routing between internal serial interfaces (SSIs) and external serial interfaces (audio and voice codecs). The AC timing of AUDMUX external pins is governed by the SSI module. For more information, see the respective SSI electrical specifications found within this document.

### 4.7.2 CSPI and ECSPi Timing Parameters

This section describes the timing parameters of the CSPI and ECSPi blocks. The CSPI and ECSPi have separate timing parameters for master and slave modes. The nomenclature used with the CSPI / ECSPi modules and the respective routing of these signals is shown in Table 40.

Table 40. CSPI Nomenclature and Routing

Block Instance	I/O Access
ECSPi-1	GPIO, KPP, DISP0_DAT, CSI0_DAT and EIM_D through IOMUXC
ECSPi-2	DISP0_DAT, CSI0_DAT and EIM through IOMUXC
CSPI	DISP0_DAT, EIM_A/D, SD1 and SD2 through IOMUXC

### 4.7.2.1 CSPI Master Mode Timing

Figure 30 depicts the timing of CSPI in master mode. Table 41 lists the CSPI master mode timing characteristics.

<sup>1</sup> In low speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

<sup>2</sup> In normal (full) speed mode for SD/SDIO card, clock frequency can be any value between 0–25 MHz. In high-speed mode, clock frequency can be any value between 0–50 MHz.

<sup>3</sup> In normal (full) speed mode for MMC card, clock frequency can be any value between 0–20 MHz. In high-speed mode, clock frequency can be any value between 0–52 MHz.

<sup>4</sup>To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

#### 4.7.4.2 eMMC4.4 (Dual Data Rate) eSDHCv3 AC Timing

Figure 35 depicts the timing of eMMC4.4. Table 47 lists the eMMC4.4 timing characteristics. Be aware that only DATA is sampled on both edges of the clock (not applicable to CMD).

## 4.7.5 FEC AC Timing Parameters

This section describes the electrical information of the Fast Ethernet Controller (FEC) module. The FEC is designed to support both 10 and 100 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The FEC supports the 10/100 Mbps MII (18 pins in total) and the 10 Mbps (only 7-wire interface, which uses 7 of the MII pins), for connection to an external Ethernet transceiver. For the pin list of MII and 7-wire, see the i.MX53 Reference Manual.

This section describes the AC timing specifications of the FEC. The MII signals are compatible with transceivers operating at a voltage of 3.3 V.

### 4.7.5.1 MII Receive Signal Timing

The MII receive signal timing involves the FEC\_RXD[3:0], FEC\_RX\_DV, FEC\_RX\_ER, and FEC\_RX\_CLK signals. The receiver functions correctly up to a FEC\_RX\_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement but the processor clock frequency must exceed twice the FEC\_RX\_CLK frequency. Table 48 lists the MII receive channel signal timing parameters and Figure 36 shows MII receive signal timings.

Table 48. MII Receive Signal Timing

No.	Characteristics <sup>1 2</sup>	Min	Max	Unit
M1	FEC_RXD[3:0], FEC_RX_DV, FEC_RX_ER to FEC_RX_CLK setup	5	—	ns
M2	FEC_RX_CLK to FEC_RXD[3:0], FEC_RX_DV, FEC_RX_ER hold	5	—	ns
M3	FEC_RX_CLK pulse width high	35%	65%	FEC_RX_CLK period
M4	FEC_RX_CLK pulse width low	35%	65%	FEC_RX_CLK period

<sup>1</sup> FEC\_RX\_DV, FEC\_RX\_CLK, and FEC\_RXD0 have same timing in 10 Mbps 7-wire interface mode.

<sup>2</sup> Test conditions: 25pF on each output signal.

Figure 36. MII Receive Signal Timing Diagram

#### 4.7.5.2 MII Transmit Signal Timing

The MII transmit signal timing affects the FEC\_TXD[3:0], FEC\_TX\_EN, FEC\_TX\_ER, and FEC\_TX\_CLK signals. The transmitter functions correctly up to a FEC\_TX\_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed twice the FEC\_TX\_CLK frequency.

Table 49 lists MII transmit channel timing parameters. Figure 37 shows MII transmit signal timing diagram for the values listed in Table 49.

Table 49. MII Transmit Signal Timing

Num	Characteristic <sup>1 2</sup>	Min	Max	Unit
M5	FEC_TX_CLK to FEC_TXD[3:0], FEC_TX_EN, FEC_TX_ER invalid	5	—	ns

M7	FEC_TX_CLK pulse width high	35%	65%	FEC_TX_CLK period
M8	FEC_TX_CLK pulse width low	35%	65%	FEC_TX_CLK period

<sup>1</sup> FEC\_TX\_EN, FEC\_TX\_CLK, and FEC\_TXD0 have the same timing in 10 Mbps 7-wire interface mode.

<sup>2</sup> Test conditions: 25pF on each output signal.

### 4.7.5.3 MII Async Inputs Signal Timing (FEC\_CRIS and FEC\_COL)

Table 50 lists MII asynchronous inputs signal timing information. Figure 38 shows MII asynchronous input timings listed in Table 50.

### 4.7.5.4 MII Serial Management Channel Timing (FEC\_MDIO and FEC\_MDC)

Table 51 lists MII serial management channel timings. Figure 39 shows MII serial management channel timings listed in Table 51. The MDC frequency should be equal to or less than 2.5 MHz to be compliant with the IEEE 802.3 MII specification. However, the FEC can function correctly with a maximum MDC frequency of 15 MHz.

Table 51. MII Transmit Signal Timing

ID	Characteristics <sup>1</sup>	Min	Max	Unit

#### 4.7.5.5 RMII Mode Timing

In RMII mode, FEC\_TX\_CLK is used as the REF\_CLK which is a 50 MHz  $\pm$ 50 ppm continuous reference clock. FEC\_RX\_DV is used as the CRS\_DV in RMII, and other signals under RMII mode include FEC\_TX\_EN, FEC\_TXD[1:0], FEC\_RXD[1:0] and optional FEC\_RX\_ER.

The RMII mode timings are shown in Table 52 and Figure 40.

Table 52. RMII Signal Timing

### 4.7.6 Flexible Controller Area Network (FLEXCAN) AC Electrical Specifications

The electrical characteristics are related to the CAN transceiver external to i.MX53xA such as MC33902 from Freescale. The i.MX53xA has two CAN modules available for systems design. Tx and Rx ports for both modules are multiplexed with other I/O pins. See the IOMUXC chapter of the i.MX53 reference manual to see which pins expose Tx and Rx pins; these ports are named TXCAN and RXCAN, respectively.

## 4.7.7 I<sup>2</sup>C Module Timing Parameters

This section describes the timing parameters of the I<sup>2</sup>C module. Figure 41 depicts the timing of I<sup>2</sup>C module, and Table 53 lists the I<sup>2</sup>C module timing characteristics.

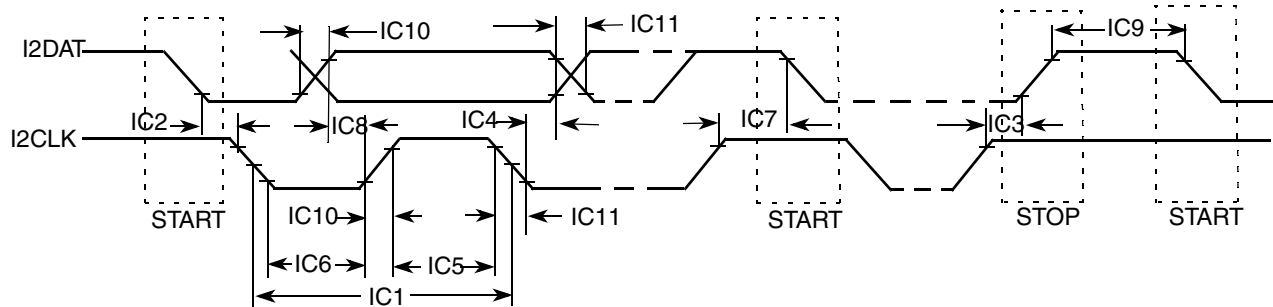

Figure 41. I<sup>2</sup>C Bus Timing

Table 53. I<sup>2</sup>C Module Timing Parameters

ID	Parameter	Standard Mode Supply Voltage = 1.65 V–1.95 V, 2.7 V–3.3 V		Fast Mode Supply Voltage = 2.7 V–3.3 V		Unit
		Min	Max	Min	Max

IC2	Hold time (repeated) START condition	4.0	—	0.6	—	μs
IC3	Set-up time for STOP condition	4.0	—	0.6	—	μs
IC4	Data hold time	0 <sup>1</sup>	3.45 <sup>2</sup>	0 <sup>1</sup>	0.9 <sup>2</sup>	μs
IC5	HIGH Period of I2CLK Clock	4.0	—	0.6	—	μs
IC6	LOW Period of the I2CLK Clock	4.7	—	1.3	—	μs
IC7	Set-up time for a repeated START condition	4.7	—	0.6	—	μs
IC8	Data set-up time	250	—	100 <sup>3</sup>	—	ns
IC9	Bus free time between a STOP and START condition	4.7	—	1.3	—	μs
IC10	Rise time of both I2DAT and I2CLK signals	—	1000	20 + 0.1C <sub>b</sub> <sup>4</sup>	300	ns
IC11	Fall time of both I2DAT and I2CLK signals	—	300	20 + 0.1C <sub>b</sub> <sup>4</sup>	300	ns
IC12	Capacitive load for each bus line (C <sub>b</sub> )	—	400	—	400	pF

<sup>1</sup> A device must internally provide a hold time of at least 300 ns for I2DAT signal in order to bridge the undefined region of the falling edge of I2CLK.

<sup>2</sup> The maximum hold time has only to be met if the device does not stretch the LOW period (ID no IC5) of the I2CLK signal.

<sup>3</sup> A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement of Set-up time (ID No IC7) of 250 ns must be met. This automatically is the case if the device does not stretch the LOW period of the I2CLK signal. If such a device does stretch the LOW period of the I2CLK signal, it must output the next data bit to the I2DAT line  $\text{max\_rise\_time (IC9)} + \text{data\_setup\_time (IC7)} = 1000 + 250 = 1250$  ns (according to the Standard-mode I2C-bus specification) before the I2CLK line is released.

<sup>4</sup> C<sub>b</sub> = total capacitance of one bus line in pF.

## 4.7.8 Image Processing Unit (IPU) Module Parameters

The purpose of the IPU is to provide comprehensive support for the flow of data from an image sensor and/or to a display device. This support covers all aspects of these activities:

- Connectivity to relevant devices—cameras, displays, graphics accelerators, and TV encoders.
- Related image processing and manipulation: sensor image signal processing, display processing, image conversions, and other related functions.
- Synchronization and control capabilities, such as avoidance of tearing artifacts.

### 4.7.8.1 IPU Sensor Interface Signal Mapping

The IPU supports a number of sensor input formats. [Table 54](#) defines the mapping of the Sensor Interface Pins used for various supported interface formats.

<sup>1</sup> CSIx stands for CSI1 or CSI2

- <sup>2</sup> The MSB bits are duplicated on LSB bits implementing color extension
- <sup>3</sup> The two MSB bits are duplicated on LSB bits implementing color extension
- <sup>4</sup> RGB 16 bits – supported in two ways: (1) As a “generic data” input – with no on-the-fly processing; (2) With on-the-fly processing, but only under some restrictions on the control protocol.
- <sup>5</sup> YCbCr 16 bits - supported as a “generic-data” input – with no on-the-fly processing.
- <sup>6</sup> YCbCr 16 bits - supported as a sub-case of the YCbCr, 20 bits, under the same conditions (BT.1120 protocol).
- <sup>7</sup> YCbCr, 20 bits, supported only within the BT.1120 protocol (syncs embedded within the data stream).

## 4.7.8.2 Sensor Interface Timings

There are three camera timing modes supported by the IPU.

### 4.7.8.2.1 BT.656 and BT.1120 Video Mode

Smart camera sensors, which include imaging processing, usually support video mode transfer. They use an embedded timing syntax to replace the SENSB\_VSYNC and SENSB\_HSYNC signals. The timing syntax is defined by the BT.656/BT.1120 standards.

This operation mode follows the recommendations of ITU BT.656/ ITU BT.1120 specifications. The only control signal used is SENSB\_PIX\_CLK. Start-of-frame and active-line signals are embedded in the data stream. An active line starts with a SAV code and ends with a EAV code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, thus recovering SENSB\_VSYNC and SENSB\_HSYNC signals for internal use. On BT.656 one component per cycle is received over the SENSB\_DATA bus. On BT.1120 two components per cycle are received over the SENSB\_DATA bus.

### 4.7.8.2.2 Gated Clock Mode

The SENSB\_VSYNC, SENSB\_HSYNC, and SENSB\_PIX\_CLK signals are used in this mode. See [Figure 42](#).

**Figure 42. Gated Clock Mode Timing Diagram**

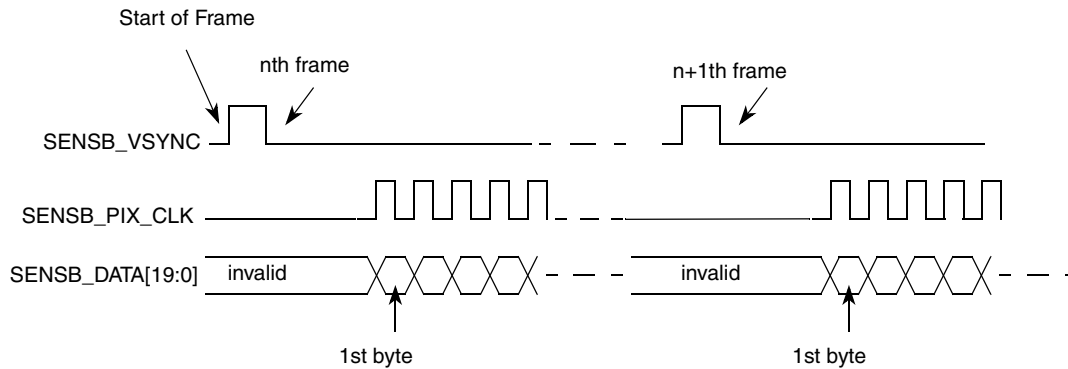

A frame starts with a rising edge on SENSB\_VSYNC (all the timings correspond to straight polarity of the corresponding signals). Then SENSB\_HSYNC goes to high and hold for the entire line. Pixel clock is valid as long as SENSB\_HSYNC is high. Data is latched at the rising edge of the valid pixel clocks.

## Electrical Characteristics

SENSB\_HSYNC goes to low at the end of line. Pixel clocks then become invalid and the CSI stops receiving data from the stream. For next line the SENSB\_HSYNC timing repeats. For next frame the SENSB\_VSYNC timing repeats.

### 4.7.8.2.3 Non-Gated Clock Mode

The timing is the same as the gated-clock mode (described in [Section 4.7.8.2.2, “Gated Clock Mode,”](#)) except for the SENSB\_HSYNC signal, which is not used (see [Figure 43](#)). All incoming pixel clocks are valid and cause data to be latched into the input FIFO. The SENSB\_PIX\_CLK signal is inactive (states low) until valid data is going to be transmitted over the bus.

**Figure 43. Non-Gated Clock Mode Timing Diagram**

The timing described in [Figure 43](#) is that of a typical sensor. Some other sensors may have a slightly different timing. The CSI can be programmed to support rising/falling-edge triggered SENSB\_VSYNC; active-high/low SENSB\_HSYNC; and rising/falling-edge triggered SENSB\_PIX\_CLK.

### 4.7.8.3 Electrical Characteristics

[Figure 44](#) depicts the sensor interface timing. SENSB\_MCLK signal described here is not generated by the IPU. [Table 55](#) lists the sensor interface timing characteristics.

**Figure 44. Sensor Interface Timing Diagram**

#### 4.7.8.4 IPU Display Interface Signal Mapping

The IPU supports a number of display output video formats. [Table 56](#) defines the mapping of the Display Interface Pins used during various supported video interface formats.

<sup>1</sup> Signal mapping (both data and control/synchronization) is flexible. The table provides examples.

<sup>2</sup> This mode works in compliance with recommendation ITU-R BT.656. The timing reference signals (frame start, frame end, line start, and line end) are embedded in the 8-bit data bus. Only video data is supported, transmission of non-video related data during blanking intervals is not supported.

**NOTE**

Table 56 provides information for both the Disp0 and Disp1 ports. However, Disp1 port has reduced pinout depending on IOMUXC configuration and therefore may not support all the above configurations. See the IOMUXC table for details.

**4.7.8.5 IPU Display Interface Timing**

The IPU Display Interface supports two kinds of display accesses: synchronous and asynchronous. There are two groups of external interface pins to provide synchronous and asynchronous controls accordantly.

**4.7.8.5.1 Synchronous Controls**

The synchronous control changes its value as a function of a system or of an external clock. This control has a permanent period and a permanent wave form.

There are special physical outputs to provide synchronous controls:

- The `ipp_disp_clk` is a dedicated base synchronous signal that is used to generate a base display (component, pixel) clock for a display.
- The `ipp_pin_1–ipp_pin_7` are general purpose synchronous pins, that can be used to provide HSYNC, VSYNC, DRDY or any else independent signal to a display.

The IPU has a system of internal binding counters for internal events (such as HSYNC/VSYCN and so on) calculation. The internal event (local start point) is synchronized with internal `DI_CLK`. A suitable control starts from the local start point with predefined UP and DOWN values to calculate control's changing points with half `DI_CLK` resolution. A full description of the counters system can be found in the IPU chapter of the i.MX53 Reference Manual.

**4.7.8.5.2 Asynchronous Controls**

The asynchronous control is a data-oriented signal that changes its value with an output data according to additional internal flags coming with the data.

There are special physical outputs to provide asynchronous controls, as follows:

- The `ipp_d0_cs` and `ipp_d1_cs` pins are dedicated to provide chip select signals to two displays.
- The `ipp_pin_11–ipp_pin_17` are general purpose asynchronous pins, that can be used to provide WR, RD, RS or any other data oriented signal to display.

**NOTE**

The IPU has independent signal generators for asynchronous signals toggling. When a DI decides to put a new asynchronous data in the bus, a new internal start (local start point) is generated. The signals generators calculate predefined UP and DOWN values to change pins states with half `DI_CLK` resolution.

## 4.7.8.6 Synchronous Interfaces to Standard Active Matrix TFT LCD Panels

### 4.7.8.6.1 IPU Display Operating Signals

The IPU uses four control signals and data to operate a standard synchronous interface:

- IPP\_DISP\_CLK—Clock to display
- HSYNC—Horizontal synchronization
- VSYNC—Vertical synchronization
- DRDY—Active data

All synchronous display controls are generated on the base of an internally generated “local start point”. The synchronous display controls can be placed on time axis with DI’s offset, up and down parameters. The display access can be whole number of DI clock (Tdiclk) only. The IPP\_DATA can not be moved relative to the local start point.

### 4.7.8.6.2 LCD Interface Functional Description

Figure 45 depicts the LCD interface timing for a generic active matrix color TFT panel. In this figure signals are shown with negative polarity. The sequence of events for active matrix interface timing is:

- DI\_CLK internal DI clock, used for calculation of other controls.
- IPP\_DISP\_CLK latches data into the panel on its negative edge (when positive polarity is selected). In active mode, IPP\_DISP\_CLK runs continuously.
- HSYNC causes the panel to start a new line. (Usually IPP\_PIN\_2 is used as HSYNC.)
- VSYNC causes the panel to start a new frame. It always encompasses at least one HSYNC pulse. (Usually IPP\_PIN\_3 is used as VSYNC.)
- DRDY acts like an output enable signal to the CRT display. This output enables the data to be shifted onto the display. When disabled, the data is invalid and the trace is off. (DRDY can be used either synchronous or asynchronous generic purpose pin as well.)

4.7.8.6.3 TFT Panel Sync Pulse Timing Diagrams

Figure 46 depicts the horizontal timing (timing of one line), including both the horizontal sync pulse and the data. All the parameters shown in the figure are programmable. All controls are started by corresponding internal events—local start points. The timing diagrams correspond to inverse polarity of the IPP\_DISP\_CLK signal and active-low polarity of the HSYNC, VSYNC, and DRDY signals.

Figure 47 depicts the vertical timing (timing of one frame). All parameters shown in the figure are programmable.

$$\bar{T}_{dicp} = T_{diclk} \times \frac{DISP\_CLK\_PERIOD}{DI\_CLK\_PERIOD}$$

<sup>2</sup> DI's counter can define offset, period and UP/DOWN characteristic of output signal according to programed parameters of the counter. Same of parameters in the table are not defined by DI's registers directly (by name), but can be generated by corresponding DI's counter. The SCREEN\_WIDTH is an input value for DI's HSYNC generation counter. The distance between HSYNCs is a SCREEN\_WIDTH.

The maximal accuracy of UP/DOWN edge of controls is:

$$\text{Accuracy} = (0.5 \times T_{diclk}) \pm 0.62\text{ns}$$

The maximal accuracy of UP/DOWN edge of IPP\_DATA is:

$$\text{Accuracy} = T_{\text{diclk}} \pm 0.62\text{ns}$$

The DISP\_CLK\_PERIOD, DI\_CLK\_PERIOD parameters are programmed through the registers.

Figure 48 depicts the synchronous display interface timing for access level. The DISP\_CLK\_DOWN and DISP\_CLK\_UP parameters are set through the Register. Table 58 lists the synchronous display interface timing characteristics.

### 4.7.8.7 Interface to a TV Encoder (TVDAC)

The interface has an 8-bit data bus, transferring a single 8-bit value (Y/U/V) in each cycle. The timing of the interface is described in [Figure 49](#).

#### NOTE

- The frequency of the clock DISP\_CLK is 27 MHz (within 10%)
- The HSYNC, VSYNC signals are active low.
- The DRDY signal is shown as active high.
- The transition to the next row is marked by the negative edge of the HSYNC signal. It remains low for a single clock cycle.
- The transition to the next field/frame is marked by the negative edge of the VSYNC signal. It remains low for at least one clock cycles.
  - At a transition to an odd field (of the next frame), the negative edges of VSYNC and HSYNC coincide.
  - At a transition to an even field (of the same frame), they do not coincide.
- The active intervals—during which data is transferred—are marked by the HSYNC signal being high.

### 4.7.8.8 Asynchronous Interfaces

The following sections describes the types of asynchronous interfaces.

#### 4.7.8.8.1 Standard Parallel Interfaces

The IPU has four signal generator machines for asynchronous signal. Each machine generates IPU's internal control levels (0 or 1) by UP and DOWN that are defined in registers. Each asynchronous pin has a dynamic connection with one of the signal generators. This connection is redefined again with a new display access (pixel/component). The IPU can generate control signals according to system 80/68 requirements. The burst length is received as a result from predefined behavior of the internal signal generator machines.

The access to a display is realized by the following:

- CS (IPP\_CS) chip select
- WR (IPP\_PIN\_11) write strobe
- RD (IPP\_PIN\_12) read strobe
- RS (IPP\_PIN\_13) Register select (A0)

Both system 80 and system 68k interfaces are supported for all described modes as depicted in [Figure 50](#), [Figure 51](#), [Figure 52](#), and [Figure 53](#). The timing images correspond to active-low IPP\_CS, WR and RD signals.

Each asynchronous access is defined by an access size parameter. This parameter can be different between different kinds of accesses. This parameter defines a length of windows, when suitable controls of the current access are valid. A pause between two different display accesses can be guaranteed by programing suitable access sizes. There are no minimal/maximal hold/setup times hard defined by DI. Each control signal can be switched at any time during access size.

Display operation can be performed with IPP\_WAIT signal. The DI reacts to the incoming IPP\_WAIT signal with 2 DI\_CLK delay. The DI finishes a current access and a next access is postponed until IPP\_WAIT release. [Figure 54](#) shows timing of the parallel interface with IPP\_WAIT control.

#### 4.7.8.8.2 Asynchronous Parallel Interface Timing Parameters

Figure 55 depicts timing of asynchronous parallel interfaces based on the system 80 and system 68k interfaces. Table 61 shows timing characteristics at display access level. All timing diagrams are based on active low control signals (signals polarity is controlled through the DI\_DISP\_SIG\_POL register).

### 4.7.8.9 Standard Serial Interfaces

The IPU supports the following types of asynchronous serial interfaces:

1. 3-wire (with bidirectional data line).
2. 4-wire (with separate data input and output lines).
3. 5-wire type 1 (with sampling RS by the serial clock).
4. 5-wire type 2 (with sampling RS by the chip select signal).

The IPU has four independent outputs and one input. The port can be configured to provide 3, 4, or 5-wire interfaces.

**Figure 56** depicts the timing diagram of the 3-wire serial interface. The timing diagrams correspond to active-low IPP#\_CS signal and the straight polarity of the IPP\_CLK signal.

For this interface, a bidirectional data line is used outside the chip. The IPU still uses separate input and output data lines (IPP\_IND\_DISP<sub>B</sub>\_SD\_D and IPP\_DO\_DISP<sub>B</sub>\_SD\_D). The I/O mux should provide joining the internal data lines to the bidirectional external line according to the IPP\_OBE\_DISP<sub>B</sub>\_SD\_D signal provided by the IPU.

**Figure 56. 3-Wire Serial Interface Timing Diagram**

Figure 57 depicts timing diagram of the 4-wire serial interface. For this interface, there are separate input and output data lines both inside and outside the chip.

Figure 58 depicts timing of the 5-wire serial interface. For this interface, a separate RS line is added.

#### 4.7.12 Pulse Width Modulator (PWM) Timing Parameters

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMO) external pin.

Figure 66 depicts the timing of the PWM, and Table 68 lists the PWM timing parameters.

### 4.7.13 PATA Timing Parameters

This section describes the timing parameters of the Parallel ATA module which are compliant with ATA/ATAPI-6 specification.

Parallel ATA module can work on PIO/Multi-Word DMA/Ultra DMA transfer modes. Each transfer mode has different data transfer rate, Ultra DMA mode 4 data transfer rate is up to 100MB/s. Parallel ATA module interface consist of a total of 29 pins. Some pins act on different function in different transfer mode. There are different requirements of timing relationships among the function pins conform with ATA/ATAPI-6 specification and these requirements are configurable by the ATA module registers.

Table 69 and Figure 67 define the AC characteristics of all the PATA interface signals in all data transfer modes.

ATA Interface Signals

Figure 67. PATA Interface Signals Timing Diagram

Table 69. AC Characteristics of All Interface Signals

ID	Parameter	Symbol	Min	Max	Unit
SI1	Rising edge slew rate for any signal on ATA interface <sup>1</sup>	$S_{rise}$	—	1.25	V/ns
SI2	Falling edge slew rate for any signal on ATA interface <sup>1</sup>	$S_{fall}$	—	1.25	V/ns
SI3	Host interface signal capacitance at the host connector	$C_{host}$	—	20	pF

<sup>1</sup> SRISE and SFALL shall meet this requirement when measured at the sender's connector from 10–90% of full signal amplitude with all capacitive loads from 15–40 pF where all signals have the same capacitive load value.

## Electrical Characteristics

The user must use level shifters for 5.0 V compatibility on the ATA interface. The i.MX53xA PATA interface is 3.3 V compatible.

The use of bus buffers introduces delay on the bus and skew between signal lines. These factors make it difficult to operate the bus at the highest speed (UDMA-5) when bus buffers are used. If fast UDMA mode operation is needed, this may not be compatible with bus buffers.

Another area of attention is the slew rate limit imposed by the ATA specification on the ATA bus. According to this limit, any signal driven on the bus should have a slew rate between 0.4 and 1.2 V/ns with a 40 pF load. Not many vendors of bus buffers specify slew rate of the outgoing signals.

When bus buffers are used, the `ata_data` bus buffer is special. This is a bidirectional bus buffer, so a direction control signal is needed. This direction control signal is `ata_buffer_en`. When its high, the bus should drive from host to device. When its low, the bus should drive from device to host. Steering of the signal is such that contention on the host and device tri-state busses is always avoided.

In the timing equations, some timing parameters are used. These parameters depend on the implementation of the i.MX53xA PATA interface on silicon, the bus buffer used, the cable delay and cable skew. [Table 70](#) shows ATA timing parameters.

## 4.7.14 SATA PHY Parameters

This section describes SATA PHY electrical specifications.

### 4.7.14.1 Reference Clock Electrical and Jitter Specifications

The refclk signal is differential and supports frequencies of 25 MHz or 50-156.25 MHz (100 MHz and 125 MHz are common frequencies). The frequency is pin-selectable (for more information about the signal, see “Per-Transceiver Control and Status Signals” in the SATA PHY chapter in the Reference Manual).

Table 76 provides the SATA PHY reference clock specifications.

Table 76. Reference Clock Specifications

Parameters	Test Conditions	Min	Max	Unit
Differential peak voltage (typically 0.71 V)	—	350	850	mV
Common mode voltage (refclk_p + refclk_m) / 2	—	175	2,000	mV
Total phase jitter	For information about total phase jitter, see following section	—	3	ps RMS
Minimum/maximum duty cycle	—	40	60	% UI
Frequency range	—	25	156.25	MHz

#### 4.7.14.1.1 Reference Clock Jitter Measurement

The total phase jitter on the reference clock is specified at 3 ps RMS. There are numerous ways to measure the reference clock jitter, one of which is as follows.

Using a high-speed sampling scope (20 GSamples/s), 1 million samples of the differential reference clock are taken, and the zero-crossing times of each rising edge are calculated. From the zero-crossing data, an average reference clock period is calculated. This average reference clock period is subtracted from each sequential, instantaneous period to find the difference between each reference clock rising edge and the ideal placement to produce the phase jitter sequence. The power spectral density (PSD) of the phase jitter is calculated and integrated after being weighted with the transfer function shown in Figure 78. The square root of the resultant integral is the RMS total phase jitter.

Figure 78. Weighting Function for RMS Phase Jitter Calculation

#### 4.7.14.2 Transmitter and Receiver Characteristics

The SATA PHY meets or exceeds the electrical compliance requirements defined in the SATA specification. The following subsections provide values obtained from a combination of simulations and silicon characterization.

##### NOTE

The tables in the following sections indicate any exceptions to the SATA specification or aspects of the SATA PHY that exceed the standard, as well as provide information about parameters not defined in the standard.

##### 4.7.14.2.1 SATA PHY Transmitter Characteristics

Table 77 provides specifications for SATA PHY transmitter characteristics.

Table 77. SATA2 PHY Transmitter Characteristics

Parameters	Symbol	Min	Typ	Max	Unit
Transmit common mode voltage	$V_{CTM}$	0.4	—	0.6	V
Transmitter pre-emphasis accuracy (measured change in de-emphasized bit)	—	-0.5	—	0.5	dB

#### 4.7.14.2.2 SATA PHY Receiver Characteristics

Table 78 provides specifications for SATA PHY receiver characteristics.

**Table 78. SATA PHY Receiver Characteristics**

Parameters	Symbol	Min	Typ	Max	Unit
Minimum Rx eye height (differential peak-to-peak)	V <sub>MIN_RX_EYE_HEIGHT</sub>	—	—	175	mV
Tolerance	PPM	-400	—	400	ppm

#### 4.7.14.3 SATA\_REXT Reference Resistor Connection

The impedance calibration process requires connection of reference resistor 191  $\Omega$  1% precision resistor on SATA\_REXT pad to ground.

Resistor calibration consists of learning which state of the internal Resistor Calibration register causes an internal, digitally trimmed calibration resistor to best match the impedance applied to the SATA\_REXT pin. The calibration register value is then supplied to all Tx and Rx termination resistors.

During the calibration process (for a few tens of microseconds), up to 0.3 mW can be dissipated in the external SATA\_REXT resistor. At other times, no power is dissipated by the SATA\_REXT resistor.

#### 4.7.14.4 SATA Connectivity When Not in Use

##### NOTE

The Temperature Sensor is part of the SATA module. If SATA IP is disabled, the Temperature Sensor will not work as well. Temperature Sensor functionality is important in supporting high performance applications without overheating the device (at high ambient temp).

When both SATA and thermal sensor are not required, connect VP and VPH supplies to ground. The rest of the ports, both inputs and outputs (SATA\_REFCLKM, SATA\_REFCLKP, SATA\_REXT, SATA\_RXM, SATA\_RXP, SATA\_TXM) can be left floating. It is not recommended to turn off the VPH while the VP is active.

When SATA is not in use but thermal sensor is still required, both VP and VPH supplies must be powered on according to their nominal voltage levels. The reference clock input frequency must fall within the specified range of 25 MHz to 156.25 MHz. SATA\_REXT does not need to be connected, as the termination impedance is not of consequence.

### 4.7.15 SCAN JTAG Controller (SJC) Timing Parameters

Figure 79 depicts the SJC test clock input timing. Figure 80 depicts the SJC boundary scan timing. Figure 81 depicts the SJC test access port. Signal parameters are listed in Table 79.

#### 4.7.16 SPDIF Timing Parameters

The Sony/Philips Digital Interconnect Format (SPDIF) data is sent using the bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Table 80 shows SPDIF timing parameters for the Sony/Philips Digital Interconnect Format (SPDIF), including the timing of the modulating Rx clock (SRCK) for SPDIF in Rx mode and the timing of the modulating Tx clock (STCLK) for SPDIF in Tx mode.

### 4.7.17 SSI Timing Parameters

This section describes the timing parameters of the SSI module. The connectivity of the serial synchronous interfaces are summarized in [Table 81](#).

Table 81. AUDMUX Port Allocation

Port	Signal Nomenclature	Type and Access
AUDMUX port 1	SSI 1	Internal
AUDMUX port 2	SSI 2	Internal
AUDMUX port 3	AUD3	External – AUD3 I/O
AUDMUX port 4	AUD4	External – EIM or CSPI1 I/O through IOMUXC
AUDMUX port 5	AUD5	External – EIM or SD1 I/O through IOMUXC
AUDMUX port 6	AUD6	External – EIM or DISP2 through IOMUXC
AUDMUX port 7	SSI 3	Internal

**NOTE**

- The terms WL and BL used in the timing diagrams and tables refer to Word Length (WL) and Bit Length (BL).
- The SSI timing diagrams use generic signal names wherein the names used in the i.MX53 reference manual are channel specific signal names. For example, a channel clock referenced in the IOMUXC chapter as AUD3\_TXC appears in the timing diagram as TXC.

**NOTE**

- All the timings for the SSI are given for a non-inverted serial clock polarity (TSCKP/RSCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal STCK/SRCK and/or the frame sync STFS/SRFS shown in the tables and in the figures.
- All timings are on Audiomux Pads when SSI is being used for data transfer.
- The terms WL and BL refer to Word Length (WL) and Bit Length (BL).
- “Tx” and “Rx” refer to the Transmit and Receive sections of the SSI.
- For internal Frame Sync operation using external clock, the FS timing is same as that of Tx Data (for example, during AC97 mode of operation).

SS36	(Tx/Rx) External FS fall time	—	6.0	ns
SS40	SRXD setup time before (Rx) CK low	10	—	ns
SS41	SRXD hold time after (Rx) CK low	2	—	ns

**NOTE**

- All the timings for the SSI are given for a non-inverted serial clock polarity (TSCKP/RSCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal STCK/SRCK and/or the frame sync STFS/SRFS shown in the tables and in the figures.
- All timings are on Audiomux Pads when SSI is being used for data transfer.
- “Tx” and “Rx” refer to the Transmit and Receive sections of the SSI.
- The terms WL and BL refer to Word Length (WL) and Bit Length (BL).
- For internal Frame Sync operation using external clock, the FS timing is same as that of Tx Data (for example, during AC97 mode of operation).

**4.7.18 UART I/O Configuration and Timing Parameters****4.7.18.1 UART RS-232 I/O Configuration in Different Modes**

The i.MX53xA UART interfaces can serve both as DTE or DCE device. This can be configured by the DCEDTE control bit (default 0 – DCE mode). [Table 86](#) shows the UART I/O configuration based on the enabled mode.

UA6	Receive IR Pulse Duration	$t_{RIRpulse}$	1.41 $\mu$ s	$(\frac{5}{16}) \cdot (\frac{1}{F_{baud\_rate}})$	—

<sup>1</sup> The UART receiver can tolerate  $1/(16 \cdot F_{\text{baud\_rate}})$  tolerance in each bit. But accumulation tolerance in one frame must not exceed  $3/(16 \cdot F_{\text{baud\_rate}})$ .

<sup>2</sup>  $F_{\text{baud\_rate}}$ : Baud rate frequency. The maximum baud rate the UART can support is  $(\text{ipg\_perclk frequency})/16$ .

## 4.7.19 USB-OH-3 Parameters

This section describes the electrical parameters of the USB OTG port and USB HOST ports. For on-chip USB PHY parameters see [Section 4.7.20, “USB PHY Parameters.”](#)

### 4.7.19.1 Serial Interface

In order to support four serial different interfaces, the USB serial transceiver can be configured to operate in one of four modes:

- DAT\_SE0 bidirectional, 3-wire mode
- DAT\_SE0 unidirectional, 6-wire mode
- VP\_VM bidirectional, 4-wire mode
- VP\_VM unidirectional, 6-wire mode

### 4.7.19.2 Parallel Interface (Normal ULPI) Timing

Electrical and timing specifications of Parallel Interface (Normal ULPI) for Host Port2 and Port3 are presented in the subsequent sections.

**Table 99. Signal Definitions - Parallel Interface (Normal ULPI)**

Name	Direction	Signal Description
USB_Clk	In	Interface clock. All interface signals are synchronous to Clock.
USB_Data[7:0]	I/O	Bi-directional data bus, driven low by the link during idle. Bus ownership is determined by Dir.
USB_Dir	In	Direction. Control the direction of the Data bus.
USB_Stp	Out	Stop. The link asserts this signal for 1 clock cycle to stop the data stream currently on the bus.
USB_Nxt	In	Next. The PHY asserts this signal to throttle the data.

## 4.7.20 USB PHY Parameters

This section describes the USB-OTG PHY and the USB Host port PHY parameters.

### 4.7.20.1 USB PHY AC Parameters

Table 101 lists the AC timing parameters for USB PHY.

**Table 101. USB PHY AC Timing Parameters**

Parameter	Conditions	Min	Typ	Max	Unit
trise	1.5 Mbps	75	—	300	ns
	12 Mbps	4		20	
	480 Mbps	0.5			
tfall	1.5 Mbps	75	—	300	ns
	12 Mbps	4		20	
	480 Mbps	0.5			
Jitter	1.5 Mbps	—	—	10	ns
	12 Mbps			1	
	480 Mbps			0.2	

### 4.7.20.2 USB PHY Additional Electrical Parameters

Table 102 lists the parameters for additional electrical characteristics for USB PHY.

**Table 102. Additional Electrical Characteristics for USB PHY**

Parameter	Conditions	Min	Typ	Max	Unit
Vcm DC (dc level measured at receiver connector)	HS Mode LS/FS Mode	-0.05 0.8	—	0.5 2.5	V
Crossover Voltage	LS Mode FS Mode	1.3 1.3	—	2 2	V
Power supply ripple noise (analog 3.3 V)	< 160 MHz	-50	0	50	mV
Power supply ripple noise (analog 2.5 V)	< 1.2 MHz	-10	0	10	mV
	> 1.2 MHz	-50	0	50	
Power supply ripple noise (Digital 1.2 V)	All conditions	-50	0	50	mV

### 4.7.20.3 USB PHY System Clocking (SYSCLK)

Table 103 lists the USB PHY system clocking parameters.

**Table 103. USB PHY System Clocking Parameters**

Parameter	Conditions	Min	Typ	Max	Unit
Clock deviation	Reference Clock frequency 24 MHz	-150	—	150	ppm
Rise/fall time	—	—	—	200	ps
Jitter (peak-peak)	< 1.2 MHz	0	—	50	ps
Jitter (peak-peak)	> 1.2 MHz	0	—	100	ps
Duty-cycle	Reference Clock frequency 24 MHz	40	—	60	%

#### 4.7.20.4 USB PHY Voltage Thresholds

Table 104 lists the USB PHY voltage thresholds.

**Table 104. VBUS Comparators Thresholds**

Parameter	Conditions	Min	Typ	Max	Unit
A-Device Session Valid	—	0.8	1.4	2.0	V
B-Device Session Valid	—	0.8	1.4	4.0	V
B-Device Session End	—	0.2	0.45	0.8	V
VBUS Valid Comparator Threshold <sup>1</sup>	—	4.4	4.6	4.75	V

<sup>1</sup> For VBUS maximum rating, see Table 4 on page 18

#### 4.7.20.5 USB PHY Termination

USB driver impedance in FS and HS modes is  $45\ \Omega \pm 10\%$  (steady state). No external resistors required.

### 4.8 XTAL and CKIL Electricals

Table 105 shows the XTALOSC electrical specifications.

**Table 105. XTALOSC Electrical Specifications**

Parameter	Min	Typ	Max	Units
Frequency	22	24	27	MHz

#### WARNING

Due to XTALOSC automatic level controller, the power consumption depends heavily on the working frequency, C-load and crystal quality. The above results are achieved at a frequency 24 MHz, 10 pF load capacitor, 7 pF crystal shunt capacitor and  $80\ \Omega$  ESR.

Table 106 shows the XTALOSC\_32K electrical specifications.

**Table 106. XTALOSC\_32K Electrical Specifications**

Parameter	Min	Typ	Max	Units
Frequency	--	32.768/32.0 <sup>1</sup>	--	kHz

<sup>1</sup> Recommended nominal frequency 32.768 kHz.

Table 107 shows the CKIL electrical specifications.

**Table 107. CKIL Electrical Specifications**

Parameter	Min	Typ	Max	Units
Frequency	16	32.768	50	kHz

## 4.9 Integrated LDO Voltage Regulators Parameters

The PLL supplies VDD\_DIG\_PLL and VDD\_ANA\_PLL can be powered ON from internal LDO voltage regulator (default case). In this case VDD\_REG is used as internal regulator’s power source. The regulator’s output can be used as a supply for other domains such as VDDA and VDDAL1.

Table 108 shows the VDD\_DIG\_PLL and VDD\_ANA\_PLL Integrated Voltage Regulators Parameters.

**Table 108. LDO Voltage Regulators Electrical Specifications**

Parameter	Symbol	Min	Typ	Max	Units
VDD_DIG_PLL functional Voltage Range <sup>1</sup>	V <sub>VID_DIG_PLL</sub>	1.15	1.2	1.3	V
VDD_ANA_PLL functional Voltage Range <sup>1</sup>	V <sub>VDD_ANA_PLL</sub>	1.7	1.8	1.95	V
VDD_DIG_PLL and VDD_ANA_PLL accuracy	—	—	—	+/-3	%
VDD_DIG_PLL power-supply rejection ratio <sup>2</sup>	—	—	-18	—	dB
VDD_ANA_PLL power-supply rejection ratio <sup>2</sup>	—	—	-15	—	dB
Output current <sup>3</sup>	I <sub>VID_DIG_PLL+</sub> I <sub>VDD_ANA_PLL</sub>	—	—	125	mA

<sup>1</sup> VDD\_DIG\_PLL and VDD\_ANA\_PLL voltages are programmable, but should not be set outside the target functional range for proper PLL operation.

<sup>2</sup> The gain or attenuation from the input supply variation to the output of the LDO (by design).

<sup>3</sup> The limitation is for sum of the VDD\_DIG\_PLL and VDD\_ANA\_PLL current.

## 5 Boot Mode Configuration

This section provides information on boot mode configuration pins allocation and boot devices interfaces allocation.

### 5.1 Boot Mode Configuration Pins

Table 109 provides boot options, functionality, fuse values, and associated pins. Several input pins are also sampled at reset and can be used to override fuse values, depending on the value of BT\_FUSE\_SEL fuse. The boot option pins are in effect when BT\_FUSE\_SEL fuse is ‘0’ (cleared, which is the case for an unblown fuse). For detailed boot mode options configured by the boot mode pins, see i.MX53 Fuse Map document and System Boot chapter in i.MX53 Reference Manual.

### 5.3 Power setup during Boot

By default, VDD\_DIG\_PLL is driven from internal on-die 1.2 V linear regulator (LDO). In order to achieve the standard operating mode (see VDD\_DIG\_PLL on Table 6), LDO output to VDD\_DIG\_PLL should be configured by software by boot code after power-up to 1.3 V output. This is done by programming the PLL1P2\_VREG bits.

<sup>1</sup> The state immediately after reset and before ROM firmware or software has executed.

<sup>2</sup> During power-on reset this port acts as input for fuse override, ~33K $\Omega$  PU/PD recommended to set the value. See [Section 5.1, "Boot Mode Configuration Pins"](#) for details.

<sup>3</sup> During power-on reset this port acts as output for diagnostic signal INT\_BOOT

<sup>4</sup> During power-on reset this port acts as output for diagnostic signal ANY\_PU\_RST

### NOTE

KEY\_COL0 and GPIO\_19 act as output for diagnostic signals during power-on reset.
