1 Overview

The MPC860 power quad integrated communications controller (PowerQUICC™) is a versatile one-chip integrated microprocessor and peripheral combination designed for a variety of controller applications. It particularly excels in communications and networking systems. The PowerQUICC unit is referred to as the MPC860 in this hardware specification.

The MPC860 implements Power Architecture™ technology and contains a superset of Freescale's MC68360 quad integrated communications controller (QUICC), referred to here as the QUICC, RISC communications processor module (CPM). The CPU on the MPC860 is a 32-bit core built on Power Architecture technology that incorporates memory management units (MMUs) and instruction and data caches. The CPM from the MC68360 QUICC has been enhanced by the addition of the inter-integrated controller (I²C) channel. The memory controller has been enhanced, enabling the MPC860 to support any type of memory, including high-performance memories and new types of DRAMs. A PCMCIA socket controller supports up to two sockets. A real-time clock has also been integrated.

Table 1 shows the functionality supported by the MPC860 family.

2 Features

The following list summarizes the key MPC860 features:

- Embedded single-issue, 32-bit core (implementing the Power Architecture technology) with thirty-two 32-bit general-purpose registers (GPRs)
 - The core performs branch prediction with conditional prefetch without conditional execution.
 - 4- or 8-Kbyte data cache and 4- or 16-Kbyte instruction cache (see [Table 1](#))
 - 16-Kbyte instruction caches are four-way, set-associative with 256 sets; 4-Kbyte instruction caches are two-way, set-associative with 128 sets.
 - 8-Kbyte data caches are two-way, set-associative with 256 sets; 4-Kbyte data caches are two-way, set-associative with 128 sets.
 - Cache coherency for both instruction and data caches is maintained on 128-bit (4-word) cache blocks.
 - Caches are physically addressed, implement a least recently used (LRU) replacement algorithm, and are lockable on a cache block basis.
 - MMUs with 32-entry TLB, fully-associative instruction, and data TLBs
 - MMUs support multiple page sizes of 4-, 16-, and 512-Kbytes, and 8-Mbytes; 16 virtual address spaces and 16 protection groups
 - Advanced on-chip-emulation debug mode
- Up to 32-bit data bus (dynamic bus sizing for 8, 16, and 32 bits)
- 32 address lines
- Operates at up to 80 MHz
- Memory controller (eight banks)
 - Contains complete dynamic RAM (DRAM) controller
 - Each bank can be a chip select or $\overline{\text{RAS}}$ to support a DRAM bank.
 - Up to 15 wait states programmable per memory bank
 - Glueless interface to DRAM, SIMMS, SRAM, EPROM, Flash EPROM, and other memory devices
 - DRAM controller programmable to support most size and speed memory interfaces
 - Four $\overline{\text{CAS}}$ lines, four $\overline{\text{WE}}$ lines, and one $\overline{\text{OE}}$ line
 - Boot chip-select available at reset (options for 8-, 16-, or 32-bit memory)
 - Variable block sizes (32 Kbytes to 256 Mbytes)
 - Selectable write protection
 - On-chip bus arbitration logic
- General-purpose timers
 - Four 16-bit timers or two 32-bit timers
 - Gate mode can enable/disable counting
 - Interrupt can be masked on reference match and event capture.

- System integration unit (SIU)
 - Bus monitor
 - Software watchdog
 - Periodic interrupt timer (PIT)
 - Low-power stop mode
 - Clock synthesizer
 - Decrementer, time base, and real-time clock (RTC)
 - Reset controller
 - IEEE 1149.1™ Std. test access port (JTAG)
- Interrupts
 - Seven external interrupt request (IRQ) lines
 - 12 port pins with interrupt capability
 - 23 internal interrupt sources
 - Programmable priority between SCCs
 - Programmable highest priority request
- 10/100 Mbps Ethernet support, fully compliant with the IEEE 802.3u® Standard (not available when using ATM over UTOPIA interface)
- ATM support compliant with ATM forum UNI 4.0 specification
 - Cell processing up to 50–70 Mbps at 50-MHz system clock
 - Cell multiplexing/demultiplexing
 - Support of AAL5 and AAL0 protocols on a per-VC basis. AAL0 support enables OAM and software implementation of other protocols.
 - ATM pace control (APC) scheduler, providing direct support for constant bit rate (CBR) and unspecified bit rate (UBR) and providing control mechanisms enabling software support of available bit rate (ABR)
 - Physical interface support for UTOPIA (10/100-Mbps is not supported with this interface) and byte-aligned serial (for example, T1/E1/ADSL)
 - UTOPIA-mode ATM supports level-1 master with cell-level handshake, multi-PHY (up to four physical layer devices), connection to 25-, 51-, or 155-Mbps framers, and UTOPIA/system clock ratios of 1/2 or 1/3.
 - Serial-mode ATM connection supports transmission convergence (TC) function for T1/E1/ADSL lines, cell delineation, cell payload scrambling/descrambling, automatic idle/unassigned cell insertion/stripping, header error control (HEC) generation, checking, and statistics.
- Communications processor module (CPM)
 - RISC communications processor (CP)
 - Communication-specific commands (for example, GRACEFUL STOP TRANSMIT, ENTER HUNT MODE, and RESTART TRANSMIT)
 - Supports continuous mode transmission and reception on all serial channels

- Up to 8 Kbytes of dual-port RAM
- 16 serial DMA (SDMA) channels
- Three parallel I/O registers with open-drain capability
- Four baud-rate generators (BRGs)
 - Independent (can be tied to any SCC or SMC)
 - Allows changes during operation
 - Autobaud support option
- Four serial communications controllers (SCCs)
 - Ethernet/IEEE 802.3® standard optional on SCC1–4, supporting full 10-Mbps operation (available only on specially programmed devices)
 - HDLC/SDLC (all channels supported at 2 Mbps)
 - HDLC bus (implements an HDLC-based local area network (LAN))
 - Asynchronous HDLC to support point-to-point protocol (PPP)
 - AppleTalk
 - Universal asynchronous receiver transmitter (UART)
 - Synchronous UART
 - Serial infrared (IrDA)
 - Binary synchronous communication (BISYNC)
 - Totally transparent (bit streams)
 - Totally transparent (frame-based with optional cyclic redundancy check (CRC))
- Two SMCs (serial management channels)
 - UART
 - Transparent
 - General circuit interface (GCI) controller
 - Can be connected to the time-division multiplexed (TDM) channels
- One SPI (serial peripheral interface)
 - Supports master and slave modes
 - Supports multimaster operation on the same bus
- One I²C (inter-integrated circuit) port
 - Supports master and slave modes
 - Multiple-master environment support
- Time-slot assigner (TSA)
 - Allows SCCs and SMCs to run in multiplexed and/or non-multiplexed operation
 - Supports T1, CEPT, PCM highway, ISDN basic rate, ISDN primary rate, user defined
 - 1- or 8-bit resolution
 - Allows independent transmit and receive routing, frame synchronization, and clocking

Features

- Allows dynamic changes
- Can be internally connected to six serial channels (four SCCs and two SMCs)
- Parallel interface port (PIP)
 - Centronics interface support
 - Supports fast connection between compatible ports on the MPC860 or the MC68360
- PCMCIA interface
 - Master (socket) interface, release 2.1 compliant
 - Supports two independent PCMCIA sockets
 - Supports eight memory or I/O windows
- Low power support
 - Full on—all units fully powered
 - Doze—core functional units disabled except time base decremter, PLL, memory controller, RTC, and CPM in low-power standby
 - Sleep—all units disabled except RTC and PIT, PLL active for fast wake up
 - Deep sleep—all units disabled including PLL except RTC and PIT
 - Power down mode—all units powered down except PLL, RTC, PIT, time base, and decremter
- Debug interface
 - Eight comparators: four operate on instruction address, two operate on data address, and two operate on data
 - Supports conditions: = ≠ < >
 - Each watchpoint can generate a break-point internally.
- 3.3-V operation with 5-V TTL compatibility except EXTAL and EXTCLK
- 357-pin ball grid array (BGA) package

3 Maximum Tolerated Ratings

This section provides the maximum tolerated voltage and temperature ranges for the MPC860. [Table 2](#) provides the maximum ratings.

This device contains circuitry protecting against damage due to high-static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for example, either GND or V_{DD}).

Table 2. Maximum Tolerated Ratings

(GND = 0 V)

| Rating | Symbol | Value | Unit |
|-------------------------------------|--------------|------------------------|------|
| Supply voltage ¹ | V_{DDH} | -0.3 to 4.0 | V |
| | V_{DDL} | -0.3 to 4.0 | V |
| | KAPWR | -0.3 to 4.0 | V |
| | V_{DDSYN} | -0.3 to 4.0 | V |
| Input voltage ² | V_{in} | GND – 0.3 to V_{DDH} | V |
| Temperature ³ (standard) | $T_{A(min)}$ | 0 | °C |
| | $T_{j(max)}$ | 95 | °C |
| Temperature ³ (extended) | $T_{A(min)}$ | -40 | °C |
| | $T_{j(max)}$ | 95 | °C |
| Storage temperature range | T_{stg} | -55 to 150 | °C |

¹ The power supply of the device must start its ramp from 0.0 V.

² Functional operating conditions are provided with the DC electrical specifications in [Table 6](#). Absolute maximum ratings are stress ratings only; functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.

Caution: All inputs that tolerate 5 V cannot be more than 2.5 V greater than the supply voltage. This restriction applies to power-up and normal operation (that is, if the MPC860 is unpowered, voltage greater than 2.5 V must not be applied to its inputs).

³ Minimum temperatures are guaranteed as ambient temperature, T_A . Maximum temperatures are guaranteed as junction temperature, T_j .

¹ Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, airflow, power dissipation of other components on the board, and board thermal resistance.

² Per SEMI G38-87 and JEDEC JESD51-2 with the single-layer board horizontal.

³ Per JEDEC JESD51-6 with the board horizontal.

⁴ Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

⁵ Indicates the average thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1) with the cold plate temperature used for the case temperature. For exposed pad packages where the pad would be expected to be soldered, junction-to-case thermal resistance is a simulated value from the junction to the exposed pad without contact resistance.

⁶ Thermal characterization parameter indicating the temperature difference between the package top and the junction temperature per JEDEC JESD51-2.

5 Power Dissipation

Table 5 provides power dissipation information. The modes are 1:1, where CPU and bus speeds are equal, and 2:1, where CPU frequency is twice the bus speed.

Table 5. Power Dissipation (P_D)

| Die Revision | Frequency (MHz) | Typical ¹ | Maximum ² | Unit |
|-------------------|-----------------|----------------------|----------------------|------|
| D.4 (1:1 mode) | 50 | 656 | 735 | mW |
| | 66 | TBD | TBD | mW |
| D.4 (2:1 mode) | 66 | 722 | 762 | mW |
| | 80 | 851 | 909 | mW |

¹ Typical power dissipation is measured at 3.3 V.

² Maximum power dissipation is measured at 3.5 V.

NOTE

Values in Table 5 represent V_{DDL} -based power dissipation and do not include I/O power dissipation over V_{DDH} . I/O power dissipation varies widely by application due to buffer current, depending on external circuitry.

6 DC Characteristics

Table 6 provides the DC electrical characteristics for the MPC860.

7 Thermal Calculation and Measurement

For the following discussions, $P_D = (V_{DD} \times I_{DD}) + PI/O$, where PI/O is the power dissipation of the I/O drivers.

7.1 Estimation with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J , in °C can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

T_A = ambient temperature (°C)

$R_{\theta JA}$ = package junction-to-ambient thermal resistance (°C/W)

P_D = power dissipation in package

The junction-to-ambient thermal resistance is an industry standard value which provides a quick and easy estimation of thermal performance. However, the answer is only an estimate; test cases have demonstrated that errors of a factor of two (in the quantity $T_J - T_A$) are possible.

7.2 Estimation with Junction-to-Case Thermal Resistance

Historically, the thermal resistance has frequently been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

$R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)

$R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)

$R_{\theta CA}$ = case-to-ambient thermal resistance (°C/W)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user adjusts the thermal environment to affect the case-to-ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the airflow around the device, add a heat sink, change the mounting arrangement on the printed-circuit board, or change the thermal dissipation on the printed-circuit board surrounding the device. This thermal model is most useful for ceramic packages with heat sinks where some 90% of the heat flows through the case and the heat sink to the ambient environment. For most packages, a better model is required.

7.3 Estimation with Junction-to-Board Thermal Resistance

A simple package thermal model which has demonstrated reasonable accuracy (about 20%) is a two-resistor model consisting of a junction-to-board and a junction-to-case thermal resistance. The junction-to-case thermal resistance covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed-circuit board. It has been observed that the thermal performance of most plastic packages, especially PBGA packages, is strongly dependent on the board temperature; see [Figure 2](#).

Figure 2. Effect of Board Temperature Rise on Thermal Behavior

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$R_{\theta JB}$ = junction-to-board thermal resistance ($^{\circ}\text{C}/\text{W}$)

T_B = board temperature ($^{\circ}\text{C}$)

P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and by attaching the thermal balls to the ground plane.

7.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application [2], or a more accurate and complex model of the package can be used in the thermal simulation.

7.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

Ψ_{JT} = thermal characterization parameter

T_T = thermocouple temperature on top of package

P_D = power dissipation in package

The thermal characterization parameter is measured per JEDEC JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

8 Layout Practices

Each V_{DD} pin on the MPC860 should be provided with a low-impedance path to the board's supply. Each GND pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on the chip. The V_{DD} power supply should be bypassed to ground using at least four 0.1 μ F-bypass capacitors located as close as possible to the four sides of the package. The capacitor leads and associated printed circuit traces connecting to chip V_{DD} and GND should be kept to less than half an inch per capacitor lead. A four-layer board employing two inner layers as V_{CC} and GND planes is recommended.

All output pins on the MPC860 have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized in order to minimize undershoot and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data buses. Maximum PC trace lengths of 6 inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the V_{CC} and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

9 Bus Signal Timing

Table 7 provides the bus operation timing for the MPC860 at 33, 40, 50, and 66 MHz.

The maximum bus speed supported by the MPC860 is 66 MHz. Higher-speed parts must be operated in half-speed bus mode (for example, an MPC860 used at 80 MHz must be configured for a 40-MHz bus).

The timing for the MPC860 bus shown assumes a 50-pF load for maximum delays and a 0-pF load for minimum delays.

¹ Phase and frequency jitter performance results are only valid if the input jitter is less than the prescribed value.

² If the rate of change of the frequency of EXTAL is slow (that is, it does not jump between the minimum and maximum values in one cycle) or the frequency of the jitter is fast (that is, it does not stay at an extreme value for a long time) then the maximum allowed jitter on EXTAL can be up to 2%.

³ The timings specified in B4 and B5 are based on full strength clock.

⁴ The timing for \overline{BR} output is relevant when the MPC860 is selected to work with external bus arbiter. The timing for \overline{BG} output is relevant when the MPC860 is selected to work with internal bus arbiter.

⁵ The timing required for \overline{BR} input is relevant when the MPC860 is selected to work with internal bus arbiter. The timing for \overline{BG} input is relevant when the MPC860 is selected to work with external bus arbiter.

⁶ The D(0:31) and DP(0:3) input timings B18 and B19 refer to the rising edge of the CLKOUT in which the \overline{TA} input signal is asserted.

⁷ The D(0:31) and DP(0:3) input timings B20 and B21 refer to the falling edge of the CLKOUT. This timing is valid only for read accesses controlled by chip-selects under control of the UPM in the memory controller, for data beats where DLT3 = 1 in the UPM RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.)

⁸ The timing B30 refers to \overline{CS} when ACS = 00 and to \overline{WE} (0:3) when CSNT = 0.

⁹ The signal UPWAIT is considered asynchronous to the CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals as described in [Figure 18](#).

¹⁰ The \overline{AS} signal is considered asynchronous to the CLKOUT. The timing B39 is specified in order to allow the behavior specified in [Figure 21](#).

¹ The timings I39 and I40 describe the testing conditions under which the $\overline{\text{IRQ}}$ lines are tested when being defined as level-sensitive. The $\overline{\text{IRQ}}$ lines are synchronized internally and do not have to be asserted or negated with reference to the CLKOUT.

The timings I41, I42, and I43 are specified to allow the correct function of the $\overline{\text{IRQ}}$ lines detection circuitry and have no direct relation with the total system interrupt latency that the MPC860 is able to support.

¹ PSST = 1. Otherwise add PSST times cycle time.

PSHT = 0. Otherwise add PSHT times cycle time.

These synchronous timings define when the $\overline{\text{WAITx}}$ signals are detected in order to freeze (or relieve) the PCMCIA current cycle. The $\overline{\text{WAITx}}$ assertion will be effective only if it is detected 2 cycles before the PSL timer expiration. 13 FEC Electrical Characteristics

This section provides the AC electrical specifications for the Fast Ethernet controller (FEC). Note that the timing specifications for the MII signals are independent of system clock frequency (part speed designation). Also, MII signals use TTL signal levels compatible with devices operating at either 5.0 V or 3.3 V.

13.1 MII Receive Signal Timing (MII_RXD[3:0], MII_RX_DV, MII_RX_ER, MII_RX_CLK)

The receiver functions correctly up to a MII_RX_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed the MII_RX_CLK frequency – 1%.

Table 29 provides information on the MII receive signal timing.

Table 29. MII Receive Signal Timing

| Num | Characteristic | Min | Max | Unit |
|-----|--|-----|-----|-------------------|
| M1 | MII_RXD[3:0], MII_RX_DV, MII_RX_ER to MII_RX_CLK setup | 5 | — | ns |
| M2 | MII_RX_CLK to MII_RXD[3:0], MII_RX_DV, MII_RX_ER hold | 5 | — | ns |
| M3 | MII_RX_CLK pulse width high | 35% | 65% | MII_RX_CLK period |
| M4 | MII_RX_CLK pulse width low | 35% | 65% | MII_RX_CLK period |

Figure 72 shows MII receive signal timing.

Figure 72. MII Receive Signal Timing Diagram

13.2 MII Transmit Signal Timing (MII_TXD[3:0], MII_TX_EN, MII_TX_ER, MII_TX_CLK)

The transmitter functions correctly up to a MII_TX_CLK maximum frequency of 25 MHz +1%. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed the MII_TX_CLK frequency – 1%.

Table 30 provides information on the MII transmit signal timing.

Freescale Semiconductor reserves the right to make changes without further notice to any products herein. Freescale Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Freescale Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Freescale Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.
