

FEATURES

- Triaxial, digital inclinometer system**
 - ±180° measurement range, roll and pitch axes
 - ±90° gravity axis
 - ±0.1° relative accuracy
- Triaxial, digital accelerometer, high accuracy**
 - ±1.7 g measurement range
 - ±0.05° axis-to-axis alignment
- Digital internal temperature measurements**
- Digital internal power supply measurements**
- Programmable user calibration options**
 - Single command, frame alignment
 - Manual accelerometer bias correction
- Programmable operation and control**
 - Sample rate/filtering
 - Alarm conditions and indicator output
 - Input/output: data ready, alarm, general-purpose
- Power management functions**
- SPI-compatible serial interface**
- Serial number and device ID**
- Single-supply operation: 3.0 V to 3.6 V**
- Calibrated temperature range: -40°C to +85°C**
- 15 mm × 24 mm × 15 mm package with flexible connector**

APPLICATIONS

- Platform control, stabilization, and alignment
- Tilt sensing, inclinometers, and leveling
- Motion/position measurement
- Monitor/alarm devices (security, medical, safety)
- Navigation

GENERAL DESCRIPTION

The ADIS16210 *iSensor*® is a digital inclinometer system that provides precise measurements for both pitch and roll angles over a full orientation range of ±180°. It combines a MEMS tri-axial acceleration sensor with signal processing, addressable user registers for data collection/programming, and a SPI-compatible serial interface. In addition, the production process includes unit specific calibration for optimal accuracy performance. It also offers digital temperature sensor and power supply measurements together with configuration controls for in-system calibration, sample rate, filtering, alarms, I/O configuration, and power management.

The MEMS sensor elements are bound to an aluminum core for tight platform coupling and excellent mechanical stability. An internal clock drives the data sampling system, which eliminates the need for an external clock source. The SPI and data buffer structure provide convenient access to accurate sensor data and configuration controls.

The ADIS16210 is available in a 15 mm × 24 mm × 15 mm module that provides mounting tabs with M2-sized mounting holes and a flexible, edge terminated connector interface. It has an extended operating temperature range of -40°C to +125°C.

Power Supply Current	Normal mode, $T_A = 25^\circ\text{C}$		18		mA
	Sleep mode, $T_A = 25^\circ\text{C}$		230		μA

¹ The digital I/O signals are 5 V tolerant.

² Endurance is qualified as per JEDEC Standard 22, Method A117, and measured at -40°C , $+25^\circ\text{C}$, $+85^\circ\text{C}$, and $+125^\circ\text{C}$.

³ Retention lifetime equivalent at junction temperature (T_J) = 85°C as per JEDEC Standard 22, Method A117. Retention lifetime decreases with junction temperature. See Figure 22.

⁴ The start-up times presented do not include the data capture time, which is dependent on the AVG_CNT register settings.

⁵ The $\overline{\text{RST}}$ pin must be held low for at least 15 ns.

ADIS16210

TIMING SPECIFICATIONS

$T_A = 25^\circ\text{C}$, $V_{DD} = 3.3\text{ V}$, unless otherwise noted.

ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
Acceleration	
Any Axis, Unpowered	3500 g
Any Axis, Powered	3500 g
VDD to GND	-0.3 V to +6.0 V
Digital Input Voltage to GND	-0.3 V to +5.3 V
Digital Output Voltage to GND	-0.3 V to VDD + 0.3 V
Analog Inputs to GND	-0.3 V to +3.6 V
Operating Temperature Range	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 4. Package Characteristics

Package Type	θ_{JA}	θ_{JC}	Device Weight
15-Lead Module	31°C/W	11°C/W	7.2 grams

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 4. Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Type ¹	Description
1, 2	VDD	S	Power Supply, 3.3 V.
3, 4, 5, 8	GND	S	Ground.
6, 9	DNC	I	Do Not Connect. Do not connect to these pins.
7	DIO2	I/O	Digital Input/Output Line 2.
10	$\overline{\text{RST}}$	I	Reset, Active Low.
11	DIN	I	SPI, Data Input.
12	DOUT	O	SPI, Data Output. DOUT is an output when $\overline{\text{CS}}$ is low. When $\overline{\text{CS}}$ is high, DOUT is in a three-state, high impedance mode.
13	SCLK	I	SPI, Serial Clock.
14	$\overline{\text{CS}}$	I	SPI, Chip Select.
15	DIO1	I/O	Digital Input/Output Line 1.

¹ S is supply, O is output, I is input, and I/O is input/output.

BASIC OPERATION

The ADIS16210 is an autonomous system that requires no user initialization. Upon receiving a valid power supply, it initializes itself and starts sampling, processing, and loading data into the output registers. When using the factory default configuration, DIO1 provides a data ready signal. The SPI interface enables simple integration with many embedded processor platforms, as shown in Figure 5 (electrical connection) and Table 6 (processor pin descriptions).

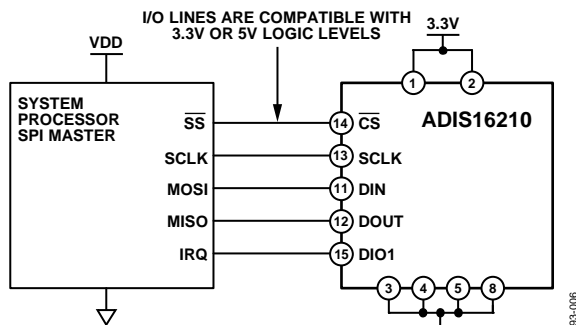

Figure 5. Electrical Connection Diagram

Table 6. Generic Master Processor Pin Names and Functions

Pin Name	Function
SS	Slave select
IRQ	Interrupt request, optional
MOSI	Master output, slave input
MISO	Master input, slave output
SCLK	Serial clock

The ADIS16210 SPI interface supports full duplex serial communication (simultaneous transmit and receive) and uses the bit sequence shown in Figure 9. Table 7 provides a list of the most common settings that initialize the serial port of a processor for the ADIS16210 SPI interface.

Table 7. Generic Master Processor SPI Settings

Processor Setting	Description
Master	ADIS16210 operates as a slave
SCLK Rate ≤ 830 kHz	Maximum serial clock rate
SPI Mode 3	CPOL = 1 (polarity), CPHA = 1 (phase)
MSB-First Mode	Bit sequence
16-Bit Mode	Shift register/data length

NOTES

1. DOUT BITS ARE PRODUCED ONLY WHEN THE PREVIOUS 16-BIT DIN SEQUENCE STARTS WITH R/W = 0.
2. WHEN CS IS HIGH, DOUT IS IN A THREE-STATE, HIGH IMPEDANCE MODE, WHICH ALLOWS MULTIFUNCTIONAL USE OF THE LINE FOR OTHER DEVICES.

Figure 9. SPI Communication Bit Sequence

READING SENSOR DATA

A single register read requires two 16-bit SPI cycles. The first cycle requests the contents of a register using the bit assignments in Figure 9. The register contents then follow on DOUT, during the second sequence.

Figure 6 includes three single register reads in succession. In this example, the process starts with DIN = 0x0400 to request the contents of the XACCL_OUT register, followed by 0x0600 to request the contents of the YACCL_OUT register, and then 0x0800 to request the contents of the ZACCL_OUT register. Full duplex operation enables processors to use the same 16-bit SPI cycle to read data from DOUT while requesting the next set of data on DIN.

Figure 6. SPI Read Example Remove

Figure 7 provides an example of four SPI signals when reading PROD_ID in a repeating pattern.

Figure 7. SPI Read Example, Second 16-Bit Sequence

DEVICE CONFIGURATION

The user register map (Table 8) provides a variety of control registers, which enable optimization for specific applications. The SPI provides access to these registers, one byte at a time, using the bit assignments shown in Figure 9. Each register has 16 bits, where Bits[7:0] represent the lower address and Bits[15:8] represent the upper address. Figure 8 displays the SPI signal pattern for writing 0x07 to Address 0x38, which sets the number of averages to 128 and the sample rate to 4 SPS.

Figure 8. Example SPI Write Pattern

USER REGISTER MAP

Figure 10 provides a diagram of the dual memory structure used to manage operation and store user settings. Writing configuration data to a control register updates its SRAM contents, which are volatile.

Most of the user registers have mirror locations in flash memory (see Table 8, for “yes” in the Flash Backup column). Use the manual flash backup command in GLOB_CMD[6] (DIN = 0xBE40) to save these settings into the nonvolatile flash memory. The flash backup process requires a valid power supply level and zero SPI communication for the entire 28 ms process time.

SENSOR DATA

OUTPUT DATA REGISTERS

The ADIS16210 provides a set of output registers for three orthogonal axes of acceleration: incline angles, internal temperature, and power supply.

Accelerometers

The accelerometers respond to both static (gravity) and dynamic acceleration using the polarity shown in Figure 11. XACCL_OUT (Table 9), YACCL_OUT (Table 10), and ZACCL_OUT (Table 11) provide user access to digital calibrated accelerometer data for each axis. For example, use DIN = 0x0400 to request the x-axis data (XACCL_OUT). After reading the contents of one of these registers, convert the 16-bit, twos complement number into a decimal equivalent, and then divide that number by 16,384 to convert the measurement into units of gravity (*g*). Table 12 provides several examples of this data format.

Table 9. XACCL_OUT (Base Address = 0x04), Read Only

Bits	Description
[15:0]	X-axis accelerometer output data, twos complement, 1 LSB = $1 g \div 16,384 = \sim 61 \mu g/LSB$, 0 <i>g</i> = 0x0000

Table 10. YACCL_OUT (Base Address = 0x06), Read Only

Bits	Description
[15:0]	Y-axis accelerometer output data, twos complement, 1 LSB = $1 g \div 16,384 = \sim 61 \mu g/LSB$, 0 <i>g</i> = 0x0000

Table 11. ZACCL_OUT (Base Address = 0x08), Read Only

Bits	Description
[15:0]	Z-axis accelerometer output data, twos complement, 1 LSB = $1 g \div 16,384 = \sim 61 \mu g/LSB$, 0 <i>g</i> = 0x0000

Table 12. Accelerometer Data Format Examples

Orientation (<i>g</i>)	Decimal	Hex	Binary

-1.7	-27,853	0x9333	1001 0011 0011 0011

Inclinometers

Registers XINCL_OUT (Table 13), YINCL_OUT (Table 14), and ZINCL_OUT (Table 15) provide access to incline angle data for each axis. For example, set DIN = 0x0E00 to request y-axis data (YINCL_OUT). Use the following process to translate the contents of these registers into degrees (°):

1. Convert the 16-bit, twos complement number into a decimal equivalent.
2. Multiply the decimal equivalent by 180.
3. Divide the result of Step 2 by 32,768.

Table 16 provides several examples of this data format.

Table 13. XINCL_OUT (Base Address = 0x0C), Read Only

Bits	Description
[15:0]	X-axis inclinometer output data, binary, 0° = 0x0000, 1 LSB = $180^\circ/32,768 = \sim 0.0055^\circ/LSB$

Table 14. YINCL_OUT (Base Address = 0x0E), Read Only

Bits	Description
[15:0]	Y-axis inclinometer output data, binary, 0° = 0x0000, 1 LSB = $180^\circ/32,768 = \sim 0.0055^\circ/LSB$

Table 15. ZINCL_OUT (Base Address = 0x10), Read Only

Bits	Description
[15:0]	Z-axis inclinometer output data, binary, 0° = 0x0000, 1 LSB = $180^\circ/32,768 = \sim 0.0055^\circ/LSB$

Table 16. Incline Angle Data Format Examples

Orientation	Decimal	Hex	Binary
+179.9945°	+32,767	0x7FFF	0111 1111 1111 1111

ZINCL_OUT	+16,384	+10,922	+10,922	+10,922	+10,922	-16,384

¹ Register setting for Z-axis gravity orientation is MSC_CTRL[7:0] = xxxx xx10.

Internal Temperature

The TEMP_OUT register (Table 18) provides access to an internal temperature measurement. Set DIN = 0x0A00 to request the contents of this register. Use the following process to translate the contents of TEMP_OUT into Celsius (°C):

1. Convert the 12-bit binary number into a decimal equivalent.
2. Subtract 1278 from the decimal equivalent.
3. Multiply the result of Step 2 by -0.47.
4. Add 25 to the result of Step 3.

Table 19 provides several examples of this data format. Note that this internal temperature measurement provides an indicator of condition changes, not an absolute measurement of conditions outside of the package.

Table 18. TEMP_OUT (Base Address = 0x0A), Read Only

Bits	Description
[15:0]	Internal temperature data, binary format, sensitivity = -0.47°/LSB, +25°C = 1278 LSB = 0x04FE

Table 19. Internal Temperature Data Format Examples

Temperature (°C)	LSB	Hex	Binary

-40	1416	0x0588	0000 0101 1000 1000

Power Supply

The SUPPLY_OUT register (Table 20) provides a digital measurement for the supply voltage on the VDD pins (see Table 5). Set DIN = 0x0200 to request the contents of this register. Use the following process to translate the contents of SUPPLY_OUT into volts (V):

1. Convert the 16-bit binary number into a decimal equivalent.
2. Multiply the decimal equivalent by 5.
3. Divide the result of Step 2 by 32,768.

Table 21 provides several examples of this data format.

Table 20. SUPPLY_OUT (Base Address = 0x02), Read Only

Bits	Description
[15:0]	Power supply measurement data, binary format, 1 LSB = $5 \div 32,768 = \sim 152.6 \mu\text{V}$, 0 V = 0x0000

Table 21. Power Supply Data Format Examples

Supply Level (V)	LSB	Hex	Binary
3.6	23,593	0x5C29	0101 1100 0010 1001
3.3 + (5 ÷ 32,768)	21,628	0x547C	0101 0100 0111 1100
3.3	21,627	0x547B	0101 0100 0111 1011
3.3 - (5 ÷ 32,768)	21,626	0x547A	0101 0100 0111 1010
3.0	19,661	0x4CCD	0100 1100 1100 1101

SIGNAL PROCESSING, BIAS CORRECTION, AND ALIGNMENT

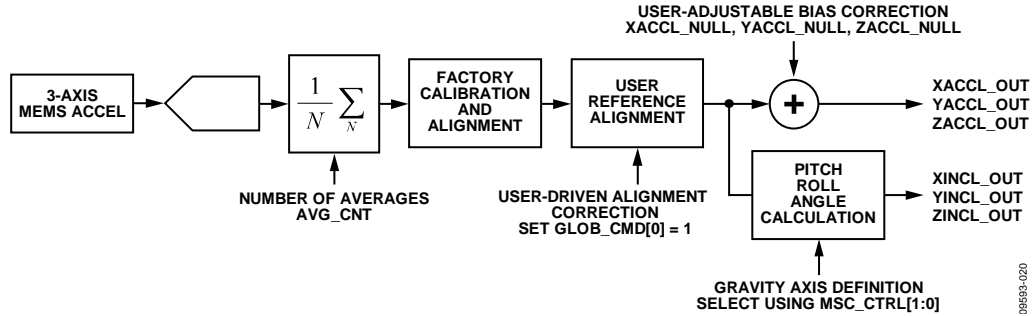

Figure 17. Sensor Signal Processing Diagram (Each Axis)

The ADIS16210 provides user controls for digital filtering, accelerometer bias correction, gravity vector axis definition, and the measurement mode.

Digital Filtering

The digital filter uses an averaging/decimating architecture to produce a low-pass response. The AVG_CNT register (Table 22) provides access to the average factor, m , which determines the number of averages (N) in the filtering stage. Table 23 provides the resulting cut-off frequency (f_c) and output register update rate (f_s) associated with each setting in AVG_CNT.

Table 22. AVG_CNT (Base Address = 0x38), Read/Write

Bits	Description (Default = 0x0009)
[15:4]	Not used
[3:0]	Average factor, m , binary format Number of averages, $N = 2^m$

Table 23. AVG_CNT Sample Rate, Bandwidth

AVG_CNT[7:0]	m	N	f_s (Output)	f_c (-3 dB)	Noise (p-p)
0x0000	0	1	512	48.2	±0.32
0x0001	1	2	256	44.6	±0.30
0x0002	2	4	128	36.1	±0.27
0x0003	3	8	64	23.9	±0.22
0x0004	4	16	32	13.5	±0.17
0x0005	5	32	16	7.0	±0.12
0x0006	6	64	8	3.5	±0.09
0x0007	7	128	4	1.8	±0.06
0x0008	8	256	2	0.89	±0.04
0x0009	9	512	1	0.44	±0.03
0x000A	10	1024	0.5	0.22	±0.02
0x000B	11	2048	0.25	0.11	±0.02

Accelerometer Bias Correction

The XACCL_NULL (Table 24), YACCL_NULL (Table 25), and ZACCL_NULL (Table 26) registers add to the accelerometer outputs to provide a bias adjustment function. They use the same format as each accelerometer output register. For example, set XACCL_NULL = 0x00F (DIN = 0x9300, 0x920F) to increase the x-axis bias by 15 LSB, or 915.5 μg ($15 \div 16,384$).

Table 24. XACCL_NULL (Base Address = 0x12), Read/Write

Bits	Description (Default = 0x0000)
[15:0]	Same format as XACCL_OUT, see Table 9

Table 25. YACCL_NULL (Base Address = 0x14), Read/Write

Bits	Description (Default = 0x0000)
[15:0]	Same format as YACCL_OUT, see Table 10

Table 26. ZACCL_NULL (Base Address = 0x16), Read/Write

Bits	Description (Default = 0x0000)
[15:0]	Same format as ZACCL_OUT, see Table 11

Gravity Vector Axis Definition

The ADIS16210 uses the following equations to translate calibrated, triaxial accelerometer data into incline angles:

$$\theta = \text{atan2} \left(\frac{a_P}{K_{GP} \sqrt{a_R^2 + a_G^2}} \right)$$

$$\phi = \text{atan2} \left(\frac{a_R}{K_{GP} \sqrt{a_P^2 + a_G^2}} \right)$$

$$\psi = \text{atan2} \left(\frac{a_G}{K_{GP} \sqrt{a_P^2 + a_R^2}} \right)$$

The pitch (θ) and roll (φ) axes provide $\pm 180^\circ$ of measurement range, whereas the gravity (ψ) axis provides $\pm 90^\circ$ of measurement range. The MSC_CTRL register (see Table 27) provides three control bits that set the orientation of the device, which assigns each accelerometer to an angle axis (pitch, roll, gravity).

Table 27. MSC_CTRL (Base Address = 0x34), Read/Write

Bits	Value	Description (Default = 0x0002)
[15:10]		Not used
[9:8]	0	Measurement mode Inclinometer
	1	Accelerometer
[7:3]		Not used
[2]	1	Gravity vector polarity, K_{GP} Negative, pointing down (-)
	0	Positive, pointing up (+)
[1:0]	00	Gravity vector orientation X = gravity vector Y = pitch axis (θ , a_P) Z = roll axis (φ , a_R)
	01	Y = gravity vector X = pitch axis (θ , a_P) Z = roll axis (φ , a_R)
	10	Z = gravity vector X = pitch axis (θ , a_P) Y = roll axis (φ , a_R)
	11	Reserved

For best use of the available range and accuracy, use Bits[2:0] in the MSC_CTRL register to establish the accelerometer that best aligns with gravity when the device is oriented at its reference point. For example, Figure 11 provides a reference point orientation, where the z-axis accelerometer aligns with gravity, for which the factory default setting for MSC_CTRL (0x0002) is optimal.

Bits[1:0] provide a control for setting the axis that is most closely aligned with the gravity vector and assigns the pitch and roll axes. Bit 2 provides a control for the direction/polarity of this. Thus, when using the factory default setting for MSC_CTRL, read XINCL_OUT for the pitch angle and YINCL_OUT for the roll angle measurements. Figure 18, Figure 19, and Figure 20 provide several examples for these settings, which are different from the factory programmed settings.

Figure 18. Z-Axis Gravity Vector, Negative Polarity
Set MSC_CTRL = 0x0006 (DIN = 0xB406)

Figure 19. X-Axis Gravity Vector, Positive Polarity
Set MSC_CTRL = 0x0000 (DIN = 0xB400)

Figure 20. Y-Axis Gravity Vector, Negative Polarity
Set MSC_CTRL = 0x0005 (DIN = 0xB405)

Measurement Mode

MSC_CTRL[8] establishes the primary measurement function. Setting MSC_CTRL[8] = 1 (DIN = 0xB501) disables signal processing on the accelerometer data, which is specific to producing incline angle measurements.

SYSTEM TOOLS

The ADIS16210 provides control registers for the following system level functions: global commands (including self test), input/output functions, device identification, status/error flags, and flash memory management.

GLOBAL COMMANDS

The GLOB_CMD register (Table 28) provides an array of single write commands. Set the assigned bit to 1 to activate each function. Proper execution of each command depends on the power supply being within normal limits and no SPI communication, during the process times listed in Table 28.

Table 28. GLOB_CMD (Base Address = 0x3E), Write Only

Bits	Description	Process Time ¹
[15:8]	Not used	N/A ²
[7]	Software reset	33.7 ms
[6]	User register save to flash memory	28.0 ms
[5]	Flash memory test	31.3 ms
[4]	Clear DIAG_STAT register	93 μs
[3]	Restore factory default configuration	68.6 ms
[2]	Self test	53.7 ms
[1]	Power-down	N/A ²
[0]	Not used	N/A ²

¹ This indicates the typical duration of time between the command write and the device returning to normal operation.

² N/A means not applicable.

Software Reset

Set GLOB_CMD[7] = 1 (DIN = 0xBE80) to execute an internal reset, which flushes all data and restores the register values to the values that are stored in nonvolatile flash memory.

User Register Save to Flash Memory

Set GLOB_CMD[6] = 1 (DIN = 0xBE40) to back up all of the current register settings into nonvolatile flash memory.

Flash Memory Test

Set GLOB_CMD[5] = 1 (DIN = 0xBE20) to execute the internal flash memory test routine, which computes a check sum verification of all flash memory locations that are not configurable through user commands.

Self Test

Set GLOB_CMD[2] = 1 (DIN = 0xBE04) to execute an internal test routine that exercises the sensors and signal processing circuit, then writes the pass/fail result to Bit 5 of the DIAG_STAT register.

Power-Down

Set GLOB_CMD[1] = 1 (DIN = 0xBE02) to put the device into sleep mode. Use the SLP_CNT register to establish the duration of the sleep period. For example, set SLP_CNT[7:0] = 0x64 (DIN = 0xBA64) to set the sleep period to 50 seconds. Set SLP_CNT[7:0] = 0x00 (DIN = 0xBA00) to establish the sleep period as indefinite. Indefinite sleep mode requires one of the three actions to wake up: negative assertion of the CS line (22.3 ms

wake-up time), a negative assertion of the $\overline{\text{RST}}$ line (33.8 ms recovery time), or a power cycle (156 ms start-up time).

Table 29. SLP_CNT (Base Address = 0x3A), Read/Write

Bits	Description (Default = 0x0000)
[15:8]	Not used
[7:0]	Binary, sleep time, 0.5 seconds/LSB 0x00 = indefinite sleep mode

INPUT/OUTPUT FUNCTIONS

The DIO_CTRL register (Table 30) provides configuration control options for the two digital I/O lines. Bits[5:4] and Bit 1 assign the function and active polarity for DIO2. Bits[3:2] and Bit 0 assigned the function and polarity for DIO1.

Table 30. DIO_CTRL (Base Address = 0x36), Read/Write

Bits	Value	Description (Default = 0x0007)
[15:6]		Not used
[5:4]		DIO2 function selection
	00	General-purpose
	01	Data ready
	10	Alarm indicator
	11	Busy signal
[3:2]		DIO1 function selection
	00	General-purpose
	01	Data ready
	10	Alarm indicator
	11	Busy signal
[1]		DIO2 polarity
	1	Active high
	0	Active low
[0]		DIO1 polarity
	1	active high
	0	active low

Data Ready Indicator

The data ready signal pulses to its inactive state when loading fresh data into the output registers, then back to its active state when the register update process completes, as shown in Figure 21, which shows the factory default operation. Set DIO_CTRL[7:0] = 0x13 (DIN = 0xB613) to change the data ready assignment to DIO2 with a positive polarity.

Figure 21. Data Ready Operation, DIO_CTRL[7:0] = 0x05

Alarm Indicator

Set DIO_CTRL[7:0] = 0x27 (DIN = 0xB627) to configure DIO2 as an alarm indicator with an active high polarity. The alarm indicator transitions to its active state when the acceleration or system data exceeds the threshold settings in the ALM_MAG_x registers. Set GLOB_CMD[4] = 1 (DIN = 0xBF10) to clear the DIAG_STAT error flags and restore the alarm indicator to its inactive state.

General-Purpose Input/Output

If DIO_CTRL configures either DIO1 or DIO2 as a general-purpose digital line, use the GPIO_CTRL register (Table 31) to configure its input/output direction, set the output level when configured as an output, and monitor the status of an input. For example, set DIO_CTRL[3:0] = 0x00 (DIN = 0xB600) to establish DIO1 as a general-purpose line, set GPIO_CTRL[0] = 1 (DIN = 0xB201) to establish DIO1 as an output, and set GPIO_CTRL[8] = 1 (DIN = 0xB301) to set DIO1 high.

Table 31. GPIO_CTRL (Base Address = 0x32), Read/Write

Bits	Description (Default = 0x0000)
[15:10]	Not used
[9]	DIO2 output level, 1 = high, 0 = low
[8]	DIO1 output level, 1 = high, 0 = low
[7:2]	Reserved
[1]	DIO2 direction control, 1 = output, 0 = input
[0]	DIO1 direction control, 1 = output, 0 = input

DEVICE IDENTIFICATION

[15:0]	0x3F52 = 16,210

Table 35. SERIAL_NUM (Base Address = 0x58), Read Only

Bits	Description
[15:0]	Serial number, lot specific

STATUS/ERROR FLAGS

The DIAG_STAT register, in Table 36, provides a number of status/error flags that reflect the conditions observed during a capture, during SPI communication and diagnostic tests. A 1 indicates an error condition and all of the error flags are sticky, which means that they remain until they are reset by setting GLOB_CMD[4] = 1 (DIN = 0xBE10). The flag in Bit 3 of the DIAG_STAT register indicates that the total number of SCLK clocks is not a multiple of 16. Set DIN = 0x3C00 to read this register.

Table 36. DIAG_STAT (Base Address = 0x3C), Read Only

Bits	Description (Default = 0x0000)
[15:12]	Not used
[11]	Alarm S flag
[10]	Alarm Z flag
[9]	Alarm Y flag
[8]	Alarm X flag
[7]	Data ready
[6]	Flash test
[5]	Self test
[4]	Not used
[3]	SPI failure
[2]	Flash update failure
[1]	VDD > 3.625
[0]	VDD < 2.975

FLASH MEMORY MANAGEMENT

Set GLOB_CMD[5] = 1 (DIN = 0xBE20) to run an internal checksum test on the flash memory, which reports a pass/fail result to DIAG_STAT[6]. The FLASH_CNT register (Table 37) provides a running count of flash memory write cycles. This is a tool for managing the endurance of the flash memory. Figure 22 quantifies the relationship between data retention and junction temperature.

Table 37. FLASH_CNT (Base Address = 0x00), Read Only

Bits	Description
[15:0]	Binary counter for writing to flash memory

Figure 22. Flash/EE Memory Data Retention

ALARMS

There are four independent alarms, which provide trigger level and polarity controls. The ALM_CTRL register (Table 38) provides individual settings for data source selection (Bits[7:4]), static and dynamic comparison (Bits[14:12]), trigger direction/polarity (Bits[11:8]), and alarm enable (Bits[3:0]).

Table 38. ALM_CTRL (Base Address = 0x2E), Read/Write

Bits	Description (Default = 0x0000)
[15]	Not used
[14]	Alarm Z, dynamic control 1 = dynamic, 0 = static
[13]	Alarm Y, dynamic control 1 = dynamic, 0 = static
[12]	Alarm X, dynamic control 1 = dynamic, 0 = static
[11]	Alarm S, comparison polarity 1 = SUPPLY_OUT/TEMP_OUT > ALM_MAG_S 0 = SUPPLY_OUT/TEMP_OUT < ALM_MAG_S
[10]	Alarm Z, comparison polarity 1 = ZACCL_OUT/ZINCL_OUT > ALM_MAG_Z 0 = ZACCL_OUT/ZINCL_OUT < ALM_MAG_Z
[9]	Alarm Y, comparison polarity 1 = YACCL_OUT/YINCL_OUT > ALM_MAG_Y 0 = YACCL_OUT/YINCL_OUT < ALM_MAG_Y
[8]	Alarm X, comparison polarity 1 = XACCL_OUT/XINCL_OUT > ALM_MAG_X 0 = XACCL_OUT/XINCL_OUT < ALM_MAG_X
[7]	Alarm S, source selection 1 = SUPPLY_OUT, 0 = TEMP_OUT
[6]	Alarm Z, source selection 1 = ZINCL_OUT, 0 = ZACCL_OUT
[5]	Alarm Y, source selection 1 = YINCL_OUT, 0 = YACCL_OUT
[4]	Alarm X, source selection 1 = XINCL_OUT, 0 = XACCL_OUT
[3]	Alarm S, enable 1 = enabled, 0 = disabled
[2]	Alarm Z, enable 1 = enabled, 0 = disabled
[1]	Alarm Y, enable 1 = enabled, 0 = disabled
[0]	Alarm X, enable 1 = enabled, 0 = disabled

SYSTEM ALARM

The system alarm monitors either power supply or internal temperature, according to the user selections in ALM_CTRL[11], ALM_CTRL[7], ALM_CTRL[3], and the ALM_MAG_S register in Table 42. For example, set ALM_CTRL = 0x0008 (DIN = 0xA900, 0xA808) and ALM_MAG_S = 0x533 (DIN = 0xA705, 0xA633) to disable all three inertial alarms and configure the system alarm active when TEMP_OUT < 0°C.

STATIC ALARMS

The static alarm setting enables the ADIS16210 to compare the data source (ALM_CTRL[6:4]) with the corresponding values

in the ALM_MAG_x registers (Table 39, Table 40, and Table 41) using the trigger direction/polarity settings in ALM_CTRL[10:8]. For example, if ALM_CTRL[10] = 0, ALM_CTRL[6] = 1, and ALM_MAG_Z = 0x2000, then Alarm Z becomes active when ZINCL_OUT is less than 0x2000, or 45°.

DYNAMIC ALARMS

The dynamic alarm setting monitors the data selection for a rate-of-change comparison. The rate-of-change comparison is represented by the magnitude in the ALM_MAG_x registers (Table 39, Table 40, and Table 41), divided by the time in the ALM_SMPL_x registers (Table 43, Table 44, Table 45).

For example, if ALM_CTRL[9] = 1, ALM_CTRL[5] = 0, ALM_MAG_Y = 0x4000, and ALM_SMPL_Y = 0x0064, then Alarm Y (DIAG_STAT[9]) becomes active when YACCL_OUT changes by more than +1 g over 100 samples. The AVG_CNT register (Table 22) establishes the time for each sample.

ALARM REPORTING

See DIAG_STAT[11:8] (Table 36) for alarm flags, which equal 1 when an alarm condition is detected. DIO_CTRL (Table 30) offers settings that configure DIO1 or DIO2 as an alarm indicator signal.

APPLICATIONS INFORMATION

INTERFACE BOARD

The ADIS16210/PCBZ provides the ADIS16210CMLZ on a small printed circuit board (PCB) that simplifies the connection to an existing processor system. This PCB provides a silkscreen for proper placement and four mounting holes, which have threads for M2 × 0.4 mm machine screws. The second set of mounting holes on the interface boards are in the four corners of the PCB and provide clearance for 4-40 machine screws. The third set of mounting holes provides a pattern that matches the ADISUSBZ evaluation system, using M2 × 0.4mm × 4 mm machine screws. These boards are made of IS410 material and are 0.063 inches thick.

J1 is a 16-pin connector, in a dual row, 2 mm geometry, which enables simple connection to a 1 mm ribbon cable system. For example, use Molex P/N 87568-1663 for the mating connector and 3M P/N 3625/16 for the ribbon cable. The LEDs (D1 and D2) are not populated, but the pads are available to install to provide a visual representation of the DIO1 and DIO2 signals. The pads accommodate Chicago Miniature Lighting Part No. CMD28-21VRC/TR8/T1, which works well when R1 and R2 are approximately 400 Ω (0603 pad sizes).

MATING CONNECTOR

The mating connector for the ADIS16210, J2, is AVX P/N 04-6288-015-000-846. Figure 25 provides a close-up view of this connector, which clamps down on the flex to press its metal pads onto the metal pads inside of the mating connector.
