

### Feature summary

- Supply voltage
  - $V_{CC} = 2.7V$  to  $3.6V$  for Program, Erase, Read
  - $V_{PP} = 12V$  for Fast Program (optional)
- Asynchronous Random/Page Read
  - Page Width: 4 Words
  - Page Access: 25ns
  - Random Access: 60ns, 70ns
- Programming time
  - $10\mu s$  per Byte/Word typical
  - 4 Words / 8 Bytes Program
- 135 Memory Blocks
  - 1 Boot Block and 7 Parameter Blocks, 8 KBytes each (Top or Bottom location)
  - 127 Main Blocks, 64 KBytes each
- Program/Erase Controller
  - Embedded Byte/Word Program algorithms
- Program/Erase Suspend and Resume
  - Read from any Block during Program Suspend
  - Read and Program another Block during Erase Suspend
- Unlock Bypass Program command
  - Faster Production/Batch Programming
- $V_{PP}/WP$  pin for Fast Program and Write Protect
- Temporary Block Unprotection mode
- Common Flash Interface
  - 64-bit Security Code

- Extended Memory Block
- Extra block used as security block or to store additional information
- Low power consumption
  - Standby and Automatic Standby
- 100,000 Program/Erase cycles per block
- Electronic Signature
  - Manufacturer Code: 0020h
- ECOPACK® packages

# 1 Summary description

The M29W640F is a 64 Mbit (8Mb x8 or 4Mb x16) non-volatile memory that can be read, erased and reprogrammed. These operations can be performed using a single low voltage (2.7 to 3.6V) supply. On power-up the memory defaults to its Read mode.

The memory is divided into blocks that can be erased independently so it is possible to preserve valid data while old data is erased. Blocks can be protected in units of 256 KByte (generally groups of four 64 KByte blocks), to prevent accidental Program or Erase commands from modifying the memory. Program and Erase commands are written to the Command Interface of the memory. An on-chip Program/Erase Controller simplifies the process of programming or erasing the memory by taking care of all of the special operations that are required to update the memory contents. The end of a program or erase operation can be detected and any error conditions identified. The command set required to control the memory is consistent with JEDEC standards.

The device features an asymmetrical blocked architecture. The device has an array of 135 blocks:

- 8 Parameter Blocks of 8 KBytes each (or 4 KWords each)
- 127 Main Blocks of 64 KBytes each (or 32 KWords each)

M29W640FT has the Parameter Blocks at the top of the memory address space while the M29W640FB locates the Parameter Blocks starting from the bottom.

The M29W640F has an extra block, the Extended Block, of 128 Words in x16 mode or of 256 Byte in x8 mode that can be accessed using a dedicated command. The Extended Block can be protected and so is useful for storing security information. However the protection is not reversible, once protected the protection cannot be undone.

Chip Enable, Output Enable and Write Enable signals control the bus operation of the memory. They allow simple connection to most microprocessors, often without additional logic.

The  $V_{PP}/\overline{WP}$  signal is used to enable faster programming of the device, enabling multiple word/byte programming. If this signal is held at  $V_{SS}$ , the boot block, and its adjacent parameter block, are protected from program and erase operations.

The device supports Asynchronous Random Read and Page Read from all blocks of the memory array.

The memories are offered in TSOP48 (12x 20mm) and TFBGA48 (6x8mm, 0.8mm pitch) packages.

In order to meet environmental requirements, Numonyx offers the M29W640FT and the M29W640FB in ECOPACK® packages. ECOPACK packages are Lead-free. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an Numonyx trademark. ECOPACK specifications are available at: [www.Numonyx.com](http://www.Numonyx.com).

The memory is delivered with all the bits erased (set to 1).

## 2 Signal descriptions

See [Figure 1: Logic diagram](#), and [Table 2: Signal names](#), for a brief overview of the signals connected to this device.

### 2.1 Address Inputs (A0-A21)

The Address Inputs select the cells in the memory array to access during Bus Read operations. During Bus Write operations they control the commands sent to the Command Interface of the Program/Erase Controller.

### 2.2 Data Inputs/Outputs (DQ0-DQ7)

The Data I/O outputs the data stored at the selected address during a Bus Read operation. During Bus Write operations they represent the commands sent to the Command Interface of the Program/Erase Controller.

### 2.3 Data Inputs/Outputs (DQ8-DQ14)

The Data I/O outputs the data stored at the selected address during a Bus Read operation when  $\overline{\text{BYTE}}$  is High,  $V_{IH}$ . When  $\overline{\text{BYTE}}$  is Low,  $V_{IL}$ , these pins are not used and are high impedance. During Bus Write operations the Command Register does not use these bits. When reading the Status Register these bits should be ignored.

### 2.4 Data Input/Output or Address Input (DQ15A-1)

When  $\overline{\text{BYTE}}$  is High,  $V_{IH}$ , this pin behaves as a Data Input/Output pin (as DQ8-DQ14). When  $\overline{\text{BYTE}}$  is Low,  $V_{IL}$ , this pin behaves as an address pin; DQ15A-1 Low will select the LSB of the addressed Word, DQ15A-1 High will select the MSB. Throughout the text consider references to the Data Input/Output to include this pin when  $\overline{\text{BYTE}}$  is High and references to the Address Inputs to include this pin when  $\overline{\text{BYTE}}$  is Low except when stated explicitly otherwise.

### 2.5 Chip Enable ( $\overline{\text{E}}$ )

The Chip Enable,  $\overline{\text{E}}$ , activates the memory, allowing Bus Read and Bus Write operations to be performed. When Chip Enable is High,  $V_{IH}$ , all other pins are ignored.

### 2.6 Output Enable ( $\overline{\text{G}}$ )

The Output Enable,  $\overline{\text{G}}$ , controls the Bus Read operation of the memory.

## 2.7 Write Enable ( $\overline{W}$ )

The Write Enable,  $\overline{W}$ , controls the Bus Write operation of the memory's Command Interface.

## 2.8 $V_{PP}$ /Write Protect ( $V_{PP}/\overline{WP}$ )

The  $V_{PP}$ /Write Protect pin provides two functions. The  $V_{PP}$  function allows the memory to use an external high voltage power supply to reduce the time required for Unlock Bypass Program operations. The Write Protect function provides a hardware method of protecting the two outermost boot blocks. The  $V_{PP}$ /Write Protect pin must not be left floating or unconnected.

When  $V_{PP}$ /Write Protect is Low,  $V_{IL}$ , the memory protects the two outermost boot blocks; Program and Erase operations in this block are ignored while  $V_{PP}$ /Write Protect is Low, even when  $\overline{RP}$  is at  $V_{ID}$ .

When  $V_{PP}$ /Write Protect is High,  $V_{IH}$ , the memory reverts to the previous protection status of the two outermost boot blocks. Program and Erase operations can now modify the data in the two outermost boot blocks unless the block is protected using Block Protection.

Applying  $V_{PPH}$  to the  $V_{PP}/\overline{WP}$  pin will temporarily unprotect any block previously protected (including the two outermost parameter blocks) using a High Voltage Block Protection technique (In-System or Programmer technique). See [Table 3: Hardware protection](#) for details.

When  $V_{PP}$ /Write Protect is raised to  $V_{PP}$  the memory automatically enters the Unlock Bypass mode. When  $V_{PP}$ /Write Protect returns to  $V_{IH}$  or  $V_{IL}$  normal operation resumes. During Unlock Bypass Program operations the memory draws  $I_{PP}$  from the pin to supply the programming circuits. See the description of the Unlock Bypass command in the Command Interface section. The transitions from  $V_{IH}$  to  $V_{PP}$  and from  $V_{PP}$  to  $V_{IH}$  must be slower than  $t_{VHVP}$ , see [Figure 13: Accelerated Program Timing waveforms](#).

Never raise  $V_{PP}$ /Write Protect to  $V_{PP}$  from any mode except Read mode, otherwise the memory may be left in an indeterminate state.

A 0.1 $\mu$ F capacitor should be connected between the  $V_{PP}$ /Write Protect pin and the  $V_{SS}$  Ground pin to decouple the current surges from the power supply. The PCB track widths must be sufficient to carry the currents required during Unlock Bypass Program,  $I_{PP}$ .

**Table 3. Hardware protection**

$V_{PP}/\overline{WP}$	$\overline{RP}$	Function
$V_{IL}$	$V_{IH}$	2 outermost parameter blocks protected from Program/Erase operations
	$V_{ID}$	All blocks temporarily unprotected except the 2 outermost blocks
$V_{IH}$ or $V_{ID}$	$V_{ID}$	All blocks temporarily unprotected
$V_{PPH}$	$V_{IH}$ or $V_{ID}$	All blocks temporarily unprotected

## 2.9 Reset/Block Temporary Unprotect ( $\overline{\text{RP}}$ )

The Reset/Block Temporary Unprotect pin can be used to apply a Hardware Reset to the memory or to temporarily unprotect all Blocks that have been protected.

Note that if  $V_{\text{PP}}/\overline{\text{WP}}$  is at  $V_{\text{IL}}$ , then the two outermost boot blocks will remain protected even if  $\text{RP}$  is at  $V_{\text{ID}}$ .

A Hardware Reset is achieved by holding Reset/Block Temporary Unprotect Low,  $V_{\text{IL}}$ , for at least  $t_{\text{LPX}}$ . After Reset/Block Temporary Unprotect goes High,  $V_{\text{IH}}$ , the memory will be ready for Bus Read and Bus Write operations after  $t_{\text{PHEL}}$  or  $t_{\text{RHEL}}$ , whichever occurs last. See the Ready/Busy Output section, [Table 17: Reset/Block Temporary Unprotect AC characteristics](#) and [Figure 12: Reset/Block Temporary Unprotect AC waveforms](#), for more details.

Holding  $\overline{\text{RP}}$  at  $V_{\text{ID}}$  will temporarily unprotect the protected Blocks in the memory. Program and Erase operations on all blocks will be possible. The transition from  $V_{\text{IH}}$  to  $V_{\text{ID}}$  must be slower than  $t_{\text{HPHH}}$ .

## 2.10 Ready/Busy Output ( $\overline{\text{RB}}$ )

The Ready/Busy pin is an open-drain output that can be used to identify when the device is performing a Program or Erase operation. During Program or Erase operations Ready/Busy is Low,  $V_{\text{OL}}$ . Ready/Busy is high-impedance during Read mode, Auto Select mode and Erase Suspend mode.

After a Hardware Reset, Bus Read and Bus Write operations cannot begin until Ready/Busy becomes high-impedance. See [Table 17: Reset/Block Temporary Unprotect AC characteristics](#) and [Figure 12: Reset/Block Temporary Unprotect AC waveforms](#), for more details.

The use of an open-drain output allows the Ready/Busy pins from several memories to be connected to a single pull-up resistor. A Low will then indicate that one, or more, of the memories is busy.

## 2.11 Byte/Word Organization Select ( $\overline{\text{BYTE}}$ )

The Byte/Word Organization Select pin is used to switch between the x8 and x16 Bus modes of the memory. When Byte/Word Organization Select is Low,  $V_{\text{IL}}$ , the memory is in x8 mode, when it is High,  $V_{\text{IH}}$ , the memory is in x16 mode.

## 2.12 $V_{CC}$ Supply Voltage (2.7V to 3.6V)

$V_{CC}$  provides the power supply for all operations (Read, Program and Erase).

The Command Interface is disabled when the  $V_{CC}$  Supply voltage is less than the Lockout Voltage,  $V_{LKO}$ . This prevents Bus Write operations from accidentally damaging the data during power up, power down and power surges. If the Program/Erase Controller is programming or erasing during this time then the operation aborts and the memory contents being altered will be invalid.

A 0.1 $\mu$ F capacitor should be connected between the  $V_{CC}$  Supply voltage pin and the  $V_{SS}$  Ground pin to decouple the current surges from the power supply. The PCB track widths must be sufficient to carry the currents required during Program and Erase operations,  $I_{CC3}$ .

## 2.13 $V_{SS}$ Ground

$V_{SS}$  is the reference for all voltage measurements. The device features two  $V_{SS}$  pins which must be both connected to the system ground.

## 3 Bus operations

There are five standard bus operations that control the device. These are Bus Read, Bus Write, Output Disable, Standby and Automatic Standby. See [Table 4: Bus operations, BYTE =  \$V\_{IL}\$](#)  and [Table 5: Bus operations, BYTE =  \$V\_{IH}\$](#) , for a summary. Typically glitches of less than 5ns on Chip Enable or Write Enable are ignored by the memory and do not affect bus operations.

### 3.1 Bus Read

Bus Read operations read from the memory cells, or specific registers in the Command Interface. A valid Bus Read operation involves setting the desired address on the Address Inputs, applying a Low signal,  $V_{IL}$ , to Chip Enable and Output Enable and keeping Write Enable High,  $V_{IH}$ . The Data Inputs/Outputs will output the value, see [Figure 8: Read Mode AC waveforms](#), and [Table 14: Read AC characteristics](#), for details of when the output becomes valid.

### 3.2 Bus Write

Bus Write operations write to the Command Interface. To speed up the read operation the memory array can be read in Page mode where data is internally read and stored in a page buffer. The Page has a size of 4 Words and is addressed by the address inputs A0-A1.

A valid Bus Write operation begins by setting the desired address on the Address Inputs. The Address Inputs are latched by the Command Interface on the falling edge of Chip Enable or Write Enable, whichever occurs last. The Data Inputs/Outputs are latched by the Command Interface on the rising edge of Chip Enable or Write Enable, whichever occurs first. Output Enable must remain High,  $V_{IH}$ , during the whole Bus Write operation. See [Figure 10: Write AC waveforms, Write Enable controlled](#), [Figure 11: Write AC waveforms, Chip Enable controlled](#), and [Table 15: Write AC characteristics, Write Enable controlled](#) and [Table 16: Write AC characteristics, Chip Enable controlled](#), for details of the timing requirements.

### 3.3 Output Disable

The Data Inputs/Outputs are in the high impedance state when Output Enable is High,  $V_{IH}$ .

### 3.4 Standby

When Chip Enable is High,  $V_{IH}$ , the memory enters Standby mode and the Data Inputs/Outputs pins are placed in the high-impedance state. To reduce the Supply Current to the Standby Supply Current,  $I_{CC2}$ , Chip Enable should be held within  $V_{CC} \pm 0.2V$ . For the Standby current level see [Table 13: DC characteristics](#).

During program or erase operations the memory will continue to use the Program/Erase Supply Current,  $I_{CC3}$ , for Program or Erase operations until the operation completes.

### 3.5 Automatic Standby

If CMOS levels ( $V_{CC} \pm 0.2V$ ) are used to drive the bus and the bus is inactive for 300ns or more the memory enters Automatic Standby where the internal Supply Current is reduced to the Standby Supply Current,  $I_{CC2}$ . The Data Inputs/Outputs will still output data if a Bus Read operation is in progress.

### 3.6 Special Bus operations

Additional bus operations can be performed to read the Electronic Signature and also to apply and remove Block Protection. These bus operations are intended for use by programming equipment and are not usually used in applications. They require  $V_{ID}$  to be applied to some pins.

#### 3.6.1 Electronic Signature

The memory has two codes, the manufacturer code and the device code, that can be read to identify the memory. These codes can be read by applying the signals listed in [Table 4: Bus operations, BYTE =  \$V\_{IL}\$](#)  and [Table 5: Bus operations, BYTE =  \$V\_{IH}\$](#) .

#### 3.6.2 Block Protect and Chip Unprotect

Groups of blocks can be protected against accidental Program or Erase. The Protection Groups are shown in [Appendix A: Block addresses Table 21](#) and [Table 22](#). The whole chip can be unprotected to allow the data inside the blocks to be changed.

The  $V_{PP}$ /Write Protect pin can be used to protect the two outermost boot blocks. When  $V_{PP}$ /Write Protect is at  $V_{IL}$  the two outermost boot blocks are protected and remain protected regardless of the Block Protection Status or the Reset/Block Temporary Unprotect pin status.

Block Protect and Chip Unprotect operations are described in [Appendix D: Block protection](#).

Read Extended Memory Block Verify Code	$V_{\text{IL}}$	$V_{\text{IL}}$	$V_{\text{IH}}$	A0-A1 = $V_{\text{IH}}$ , A2-A3 = $V_{\text{IL}}$ , A6 = $V_{\text{IL}}$ , A9 = $V_{\text{ID}}$ , Others $V_{\text{IL}}$ or $V_{\text{IH}}$	80h (Factory Locked) 00h (Customer Lockable)
Read Block Protection Status	$V_{\text{IL}}$	$V_{\text{IL}}$	$V_{\text{IH}}$	A0,A2,A3, A6 = $V_{\text{IL}}$ , A1 = $V_{\text{IH}}$ , A9 = $V_{\text{ID}}$ , A12-A21 = Block address, Others $V_{\text{IL}}$ or $V_{\text{IH}}$	0001h (protected) 0000h (unprotected)

1. X =  $V_{\text{IL}}$  or  $V_{\text{IH}}$ .

## 4 Command interface

All Bus Write operations to the memory are interpreted by the Command Interface. Commands consist of one or more sequential Bus Write operations. Failure to observe a valid sequence of Bus Write operations will result in the memory returning to Read mode. The long command sequences are imposed to maximize data security.

The address used for the commands changes depending on whether the memory is in 16-bit or 8-bit mode. See either [Table 6](#), or [Table 7](#), depending on the configuration that is being used, for a summary of the commands.

### 4.1 Standard commands

#### 4.1.1 Read/Reset command

The Read/Reset command returns the memory to its Read mode. It also resets the errors in the Status Register. Either one or three Bus Write operations can be used to issue the Read/Reset command.

The Read/Reset command can be issued, between Bus Write cycles before the start of a program or erase operation, to return the device to read mode. If the Read/Reset command is issued during the timeout of a Block Erase operation then the memory will take up to 10 $\mu$ s to abort. During the abort period no valid data can be read from the memory. The Read/Reset command will not abort an Erase operation when issued while in Erase Suspend.

#### 4.1.2 Auto Select command

The Auto Select command is used to read the Manufacturer Code, the Device Code, the Block Protection Status and the Extended Memory Block Verify Code. Three consecutive Bus Write operations are required to issue the Auto Select command. Once the Auto Select command is issued the memory remains in Auto Select mode until a Read/Reset command is issued. Read CFI Query and Read/Reset commands are accepted in Auto Select mode, all other commands are ignored.

In Auto Select mode, the Manufacturer Code and the Device Code can be read by using a Bus Read operation with addresses and control signals set as shown in [Table 4: Bus operations, BYTE =  \$V\_{IL}\$](#)  and [Table 5: Bus operations, BYTE =  \$V\_{IH}\$](#) , except for A9 that is 'Don't Care'.

The Block Protection Status of each block can be read using a Bus Read operation with addresses and control signals set as shown in [Table 4: Bus operations, BYTE =  \$V\_{IL}\$](#)  and [Table 5: Bus operations, BYTE =  \$V\_{IH}\$](#) , except for A9 that is 'Don't Care'. If the addressed block is protected then 01h is output on Data Inputs/Outputs DQ0-DQ7, otherwise 00h is output (in 8-bit mode).

The protection status of the Extended Memory block, or Extended Memory Block Verify code, can be read using a Bus Read operation with addresses and control signals set as shown in [Table 4: Bus operations, BYTE =  \$V\_{IL}\$](#)  and [Table 5: Bus operations, BYTE =  \$V\_{IH}\$](#) , except for A9 that is 'Don't Care'. If the Extended Block is "Factory Locked" then 80h is output on Data Input/Outputs DQ0-DQ7, otherwise 00h is output (8-bit mode).

### 4.1.3 Read CFI Query command

The Read CFI Query Command is used to read data from the Common Flash Interface (CFI) Memory Area. This command is valid when the device is in the Read Array mode, or when the device is in Autoselected mode.

One Bus Write cycle is required to issue the Read CFI Query Command. Once the command is issued subsequent Bus Read operations read from the Common Flash Interface Memory Area.

The Read/Reset command must be issued to return the device to the previous mode (the Read Array mode or Autoselected mode). A second Read/Reset command would be needed if the device is to be put in the Read Array mode from Autoselected mode.

See [Appendix B: Common Flash Interface \(CFI\)](#), Tables 23, 24, 25, 26, 27 and 28 for details on the information contained in the Common Flash Interface (CFI) memory area.

### 4.1.4 Chip Erase command

The Chip Erase command can be used to erase the entire chip. Six Bus Write operations are required to issue the Chip Erase Command and start the Program/Erase Controller.

If any blocks are protected then these are ignored and all the other blocks are erased. If all of the blocks are protected the Chip Erase operation appears to start but will terminate within about 100µs, leaving the data unchanged. No error condition is given when protected blocks are ignored.

During the erase operation the memory will ignore all commands, including the Erase Suspend command. It is not possible to issue any command to abort the operation. Typical chip erase times are given in [Table 8: Program, Erase times and Program, Erase Endurance cycles](#). All Bus Read operations during the Chip Erase operation will output the Status Register on the Data Inputs/Outputs. See the section on the Status Register for more details.

After the Chip Erase operation has completed the memory will return to the Read Mode, unless an error has occurred. When an error occurs the memory will continue to output the Status Register. A Read/Reset command must be issued to reset the error condition and return to Read Mode.

The Chip Erase Command sets all of the bits in unprotected blocks of the memory to '1'. All previous data is lost.

#### 4.1.5 Block Erase command

The Block Erase command can be used to erase a list of one or more blocks. Six Bus Write operations are required to select the first block in the list. Each additional block in the list can be selected by repeating the sixth Bus Write operation using the address of the additional block. The Block Erase operation starts the Program/Erase Controller about 50 $\mu$ s after the last Bus Write operation. Once the Program/Erase Controller starts it is not possible to select any more blocks. Each additional block must therefore be selected within 50 $\mu$ s of the last block. The 50 $\mu$ s timer restarts when an additional block is selected. The Status Register can be read after the sixth Bus Write operation. See the Status Register section for details on how to identify if the Program/Erase Controller has started the Block Erase operation.

If any selected blocks are protected then these are ignored and all the other selected blocks are erased. If all of the selected blocks are protected the Block Erase operation appears to start but will terminate within about 100 $\mu$ s, leaving the data unchanged. No error condition is given when protected blocks are ignored.

During the Block Erase operation the memory will ignore all commands except the Erase Suspend command. Typical block erase times are given in [Table 8: Program, Erase times and Program, Erase Endurance cycles](#). All Bus Read operations during the Block Erase operation will output the Status Register on the Data Inputs/Outputs. See the section on the Status Register for more details.

After the Block Erase operation has completed the memory will return to the Read Mode, unless an error has occurred. When an error occurs the memory will continue to output the Status Register. A Read/Reset command must be issued to reset the error condition and return to Read mode.

The Block Erase Command sets all of the bits in the unprotected selected blocks to '1'. All previous data in the selected blocks is lost.

#### 4.1.6 Erase Suspend command

The Erase Suspend Command may be used to temporarily suspend a Block Erase operation and return the memory to Read mode. The command requires one Bus Write operation.

The Program/Erase Controller will suspend within the Erase Suspend Latency time of the Erase Suspend Command being issued. Once the Program/Erase Controller has stopped the memory will be set to Read mode and the Erase will be suspended. If the Erase Suspend command is issued during the period when the memory is waiting for an additional block (before the Program/Erase Controller starts) then the Erase is suspended immediately and will start immediately when the Erase Resume Command is issued. It is not possible to select any further blocks to erase after the Erase Resume.

During Erase Suspend it is possible to Read and Program cells in blocks that are not being erased; both Read and Program operations behave as normal on these blocks. If any attempt is made to program in a protected block or in the suspended block then the Program command is ignored and the data remains unchanged. The Status Register is not read and no error condition is given. Reading from blocks that are being erased will output the Status Register.

It is also possible to issue the Auto Select, Read CFI Query and Unlock Bypass commands during an Erase Suspend. The Read/Reset command must be issued to return the device to Read Array mode before the Resume command will be accepted.

#### 4.1.7 Erase Resume command

The Erase Resume command must be used to restart the Program/Erase Controller after an Erase Suspend. The device must be in Read Array mode before the Resume command will be accepted. An erase can be suspended and resumed more than once.

#### 4.1.8 Program Suspend command

The Program Suspend command allows the system to interrupt a program operation so that data can be read from any block. When the Program Suspend command is issued during a program operation, the device suspends the program operation within the Program Suspend Latency time (see [Table 8: Program, Erase times and Program, Erase Endurance cycles](#) for value) and updates the Status Register bits.

After the program operation has been suspended, the system can read array data from any address. However, data read from Program-Suspended addresses is not valid.

The Program Suspend command may also be issued during a program operation while an erase is suspended. In this case, data may be read from any addresses not in Erase Suspend or Program Suspend. If a read is needed from the Extended Block area (One-time Program area), the user must use the proper command sequences to enter and exit this region.

The system may also issue the Auto Select command sequence when the device is in the Program Suspend mode. The system can read as many Auto Select codes as required. When the device exits the Auto Select mode, the device reverts to the Program Suspend mode, and is ready for another valid operation. See Auto Select command sequence for more information.

#### 4.1.9 Program Resume command

After the Program Resume command is issued, the device reverts to programming. The controller can determine the status of the program operation using the DQ7 or DQ6 status bits, just as in the standard program operation. See Write Operation Status for more information.

The system must write the Program Resume command, to exit the Program Suspend mode and to continue the programming operation.

Further issuing of the Resume command is ignored. Another Program Suspend command can be written after the device has resumed programming.

#### 4.1.10 Program command

The Program command can be used to program a value to one address in the memory array at a time. The command requires four Bus Write operations, the final write operation latches the address and data, and starts the Program/Erase Controller.

Programming can be suspended and then resumed by issuing a Program Suspend command and a Program Resume command, respectively (see [Section 4.1.8: Program Suspend command](#) and [Section 4.1.9: Program Resume command](#)).

If the address falls in a protected block then the Program command is ignored, the data remains unchanged. The Status Register is never read and no error condition is given.

During the program operation the memory will ignore all commands. It is not possible to issue any command to abort or pause the operation. Typical program times are given in [Table 8: Program, Erase times and Program, Erase Endurance cycles](#). Bus Read operations during the program operation will output the Status Register on the Data Inputs/Outputs. See the section on the Status Register for more details.

After the program operation has completed the memory will return to the Read mode, unless an error has occurred. When an error occurs the memory will continue to output the Status Register. A Read/Reset command must be issued to reset the error condition and return to Read mode.

Note that the Program command cannot change a bit set at '0' back to '1'. One of the Erase Commands must be used to set all the bits in a block or in the whole memory from '0' to '1'.

## 4.2 Fast Program commands

There are four Fast Program commands available to improve the programming throughput, by writing several adjacent words or bytes in parallel. The Double, Quadruple and Octuple Byte Program commands are available for x8 operations, while the Double Quadruple Word Program command are available for x16 operations.

Fast Program commands can be suspended and then resumed by issuing a Program Suspend command and a Program Resume command, respectively (see [Section 4.1.8: Program Suspend command](#) and [Section 4.1.9: Program Resume command](#)).

To perform some of the Fast Program commands,  $V_{PPH}$  must be applied to  $V_{PP}/\overline{WP}$  pin. Care must be taken because applying a  $V_{PPH}$  to the  $V_{PP}/\overline{WP}$  pin will temporarily unprotect any protected block.

### 4.2.1 Double Byte Program command

The Double Byte Program command is used to write a page of two adjacent Bytes in parallel. The two bytes must differ only in DQ15A-1. Three bus write cycles are necessary to issue the Double Byte Program command.

1. The first bus cycle sets up the Double Byte Program Command.
2. The second bus cycle latches the Address and the Data of the first byte to be written.
3. The third bus cycle latches the Address and the Data of the second byte to be written.

### 4.2.2 Quadruple Byte Program command<sup>(1)</sup>

The Quadruple Byte Program command is used to write a page of four adjacent Bytes in parallel. The four bytes must differ only for addresses A0, DQ15A-1. Five bus write cycles are necessary to issue the Quadruple Byte Program command.

1. The first bus cycle sets up the Quadruple Byte Program Command.
2. The second bus cycle latches the Address and the Data of the first byte to be written.
3. The third bus cycle latches the Address and the Data of the second byte to be written.
4. The fourth bus cycle latches the Address and the Data of the third byte to be written.
5. The fifth bus cycle latches the Address and the Data of the fourth byte to be written and starts the Program/Erase Controller.

---

1. For devices with process technology code "H" in the marking, the Quadruple Byte Program command can be performed without applying  $V_{PPH}$  on the  $V_{PP}/\overline{WP}$  pin. For other devices, applying  $V_{PPH}$  on the  $V_{PP}/\overline{WP}$  pin is mandatory.

### 4.2.3 Octuple Byte Program command

This is used to write eight adjacent Bytes, in x8 mode, simultaneously. The addresses of the eight Bytes must differ only in A1, A0 and DQ15A-1.

Nine bus write cycles are necessary to issue the command:

1. The first bus cycle sets up the command.
2. The second bus cycle latches the Address and the Data of the first Byte to be written.
3. The third bus cycle latches the Address and the Data of the second Byte to be written.
4. The fourth bus cycle latches the Address and the Data of the third Byte to be written.
5. The fifth bus cycle latches the Address and the Data of the fourth Byte to be written.
6. The sixth bus cycle latches the Address and the Data of the fifth Byte to be written.
7. The seventh bus cycle latches the Address and the Data of the sixth Byte to be written.
8. The eighth bus cycle latches the Address and the Data of the seventh Byte to be written.
9. The ninth bus cycle latches the Address and the Data of the eighth Byte to be written and starts the Program/Erase Controller.

To perform the Quadruple Byte Program command, it is necessary to apply  $V_{PPH}$  to the  $V_{PP}/\overline{WP}$  pin.

### 4.2.4 Double Word Program command<sup>(2)</sup>

The Double Word Program command is used to write a page of two adjacent Words in parallel. The two Words must differ only for the address A0.

Three bus write cycles are necessary to issue the Double Word Program command.

- The first bus cycle sets up the Quadruple Word Program Command.
- The second bus cycle latches the Address and the Data of the first Word to be written.
- The third bus cycle latches the Address and the Data of the second Word to be written and starts the Program/Erase Controller.

After the program operation has completed the memory will return to the Read mode, unless an error has occurred. When an error occurs Bus Read operations will continue to output the Status Register. A Read/Reset command must be issued to reset the error condition and return to Read mode.

Note that the Fast Program commands cannot change a bit set at '0' back to '1'. One of the Erase Commands must be used to set all the bits in a block or in the whole memory from '0' to '1'.

Typical Program times are given in [Table 8: Program, Erase times and Program, Erase Endurance cycles](#).

---

2. For devices with process technology code "H" in the marking, the Double Word Program command can be performed without applying  $V_{PPH}$  on the  $V_{PP}/\overline{WP}$  pin. For other devices, applying  $V_{PPH}$  on the  $V_{PP}/\overline{WP}$  pin is mandatory.

#### 4.2.5 Quadruple Word Program command

This is used to write a page of four adjacent Words (or 8 adjacent Bytes), in x16 mode, simultaneously. The addresses of the four Words must differ only in A1 and A0.

Five bus write cycles are necessary to issue the command:

- The first bus cycle sets up the command.
- The second bus cycle latches the Address and the Data of the first Word to be written.
- The third bus cycle latches the Address and the Data of the second Word to be written.
- The fourth bus cycle latches the Address and the Data of the third Word to be written.
- The fifth bus cycle latches the Address and the Data of the fourth Word to be written and starts the Program/Erase Controller.

To perform the Quadruple Word Program command, it is necessary to apply  $V_{PPH}$  to the  $V_{PP}/WP$  pin.

#### 4.2.6 Unlock Bypass command

The Unlock Bypass command is used in conjunction with the Unlock Bypass Program command to program the memory faster than with the standard program commands. When the cycle time to the device is long, considerable time saving can be made by using these commands. Three Bus Write operations are required to issue the Unlock Bypass command.

Once the Unlock Bypass command has been issued the memory will only accept the Unlock Bypass Program command and the Unlock Bypass Reset command. The memory can be read as if in Read mode.

When  $V_{PP}$  is applied to the  $V_{PP}/Write\ Protect$  pin the memory automatically enters the Unlock Bypass mode and the Unlock Bypass Program command can be issued immediately.

#### 4.2.7 Unlock Bypass Program command

The Unlock Bypass command is used in conjunction with the Unlock Bypass Program command to program the memory. When the cycle time to the device is long, considerable time saving can be made by using these commands. Three Bus Write operations are required to issue the Unlock Bypass command.

Once the Unlock Bypass command has been issued the memory will only accept the Unlock Bypass Program command and the Unlock Bypass Reset command. The memory can be read as if in Read mode.

The memory offers accelerated program operations through the  $V_{PP}/Write\ Protect$  pin. When the system asserts  $V_{PP}$  on the  $V_{PP}/Write\ Protect$  pin, the memory automatically enters the Unlock Bypass mode. The system may then write the two-cycle Unlock Bypass program command sequence. The memory uses the higher voltage on the  $V_{PP}/Write\ Protect$  pin, to accelerate the Unlock Bypass Program operation.

Never raise  $V_{PP}/Write\ Protect$  to  $V_{PP}$  from any mode except Read mode, otherwise the memory may be left in an indeterminate state.

#### 4.2.8 Unlock Bypass Reset command

The Unlock Bypass Reset command can be used to return to Read/Reset mode from Unlock Bypass Mode. Two Bus Write operations are required to issue the Unlock Bypass Reset command. Read/Reset command does not exit from Unlock Bypass Mode.

### 4.3 Block Protection commands

#### 4.3.1 Enter Extended Block command

The device has an extra 256 Byte block (Extended Block) that can only be accessed using the Enter Extended Block command. Three Bus write cycles are required to issue the Extended Block command. Once the command has been issued the device enters Extended Block mode where all Bus Read or Write operations to the Boot Block addresses access the Extended Block. The Extended Block (with the same address as the Boot Blocks) cannot be erased, and can be treated as one-time programmable (OTP) memory. In Extended Block mode the Boot Blocks are not accessible.

To exit from the Extended Block mode the Exit Extended Block command must be issued.

The Extended Block can be protected, however once protected the protection cannot be undone.

#### 4.3.2 Exit Extended Block command

The Exit Extended Block command is used to exit from the Extended Block mode and return the device to Read mode. Four Bus Write operations are required to issue the command.

#### 4.3.3 Block Protect and Chip Unprotect commands

Groups of blocks can be protected against accidental Program or Erase. The Protection Groups are shown in [Appendix A: Block addresses](#), [Table 21: Top Boot Block addresses, M29W640FT](#) and [Table 22: Bottom Boot Block addresses, M29W640FB](#). The whole chip can be unprotected to allow the data inside the blocks to be changed.

Block Protect and Chip Unprotect operations are described in [Appendix D: Block protection](#).

Table 6. Commands, 16-bit mode,  $\overline{\text{BYTE}} = V_{IH}^{(1)}$ 

Command	Length	Bus Write operations											
		1st		2nd		3rd		4th		5th		6th	
		Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data
Read/Reset	1	X	F0										
	3	555	AA	2AA	55	X	F0						
Auto Select	3	555	AA	2AA	55	555	90						
Program	4	555	AA	2AA	55	555	A0	PA	PD				
Double Word Program	3	555	50	PA0	PD0	PA1	PD1						
Quadruple Word Program	5	555	56	PA0	PD0	PA1	PD1	PA2	PD2	PA3	PD3		
Unlock Bypass	3	555	AA	2AA	55	555	20						
Unlock Bypass Program	2	X	A0	PA	PD								
Unlock Bypass Reset	2	X	90	X	00								
Chip Erase	6	555	AA	2AA	55	555	80	555	AA	2AA	55	555	10
Block Erase	6+	555	AA	2AA	55	555	80	555	AA	2AA	55	BA	30
Program/Erase Suspend	1	X	B0										
Program/Erase Resume	1	X	30										
Read CFI Query	1	55	98										
Enter Extended Block	3	555	AA	2AA	55	555	88						
Exit Extended Block	4	555	AA	2AA	55	555	90	X	00				

1. X Don't Care, PA Program Address, PD Program Data, BA Any address in the Block. All values in the table are in hexadecimal. The Command interface only uses A-1, A0-A10 and DQ0-DQ7 to verify the commands; A11-A20, DQ8-DQ14 and DQ15 are Don't Care. DQ15A-1 is A-1 when BYTE is  $V_{IL}$  or DQ15 when BYTE is  $V_{IH}$ .

Table 7. Commands, 8-bit mode,  $\overline{\text{BYTE}} = V_{\text{IL}}$ 

Command	Length	Bus Write operations <sup>(1)</sup>																	
		1st		2nd		3rd		4th		5th		6th		7th		8th		9th	
		Add	Data	Add	Data	Add	Data	Add	Data	Add	Data	Add	Data	Add	Data	Add	Data	Add	Data
Read/Reset	1	X	F0																
	3	AAA	AA	555	55	X	F0												
Auto Select	3	AAA	AA	555	55	AAA	90												
Program	4	AAA	AA	555	55	AAA	A0	PA	PD										
Double Byte Program	3	AAA	50	PA0	PD0	PA1	PD1												
Quadruple Byte Program	5	AAA	56	PA0	PD0	PA1	PD1	PA2	PD2	PA3	PD3								
Octuple Byte Program	9	AAA	8B	PA0	PD0	PA1	PD1	PA2	PD2	PA3	PD3	PA4	PD4	PA5	PD5	PA6	PD6	PA7	PD7
Unlock Bypass	3	AAA	AA	555	55	AAA	20												
Unlock Bypass Program	2	X	A0	PA	PD														
Unlock Bypass Reset	2	X	90	X	00														
Chip Erase	6	AAA	AA	555	55	AAA	80	AAA	AA	555	55	AAA	10						
Block Erase	6+	AAA	AA	555	55	AAA	80	AAA	AA	555	55	BA	30						
Program/Erase Suspend	1	X	B0																
Program/Erase Resume	1	X	30																
Read CFI Query	1	AA	98																
Enter Extended Block	3	AAA	AA	555	55	AAA	88												
Exit Extended Block	4	AAA	AA	555	55	AAA	90	X	00										

1. X Don't Care, PA Program Address, PD Program Data, BA Any address in the Block. All values in the table are in hexadecimal. The Command Interface only uses A-1, A0-A10 and DQ0-DQ7 to verify the commands; A11-A20, DQ8-DQ14 and DQ15 are Don't Care. DQ15A-1 is A-1 when BYTE is  $V_{\text{IL}}$  or DQ15 when BYTE is  $V_{\text{IH}}$ .

**Table 8. Program, Erase times and Program, Erase Endurance cycles**

Parameter	Min	Typ <sup>(1)(2)</sup>	Max <sup>(2)</sup>	Unit
Chip Erase		80	400 <sup>(3)</sup>	s
Block Erase (64 KBytes)		0.8	6 <sup>(4)</sup>	s
Erase Suspend Latency time			50 <sup>(4)</sup>	μs
Program (Byte or Word)		10	200 <sup>(3)</sup>	μs
Double Byte		10	200 <sup>(3)</sup>	μs
Double Word /Quadruple Byte Program		10	200 <sup>(3)</sup>	μs
Quadruple Word / Octuple Byte Program		10	200 <sup>(3)</sup>	μs
Chip Program (Byte by Byte)		80	400 <sup>(3)</sup>	s
Chip Program (Word by Word)		40	200 <sup>(3)</sup>	s
Chip Program (Double Word/Quadruple Byte Program)		20	100 <sup>(3)</sup>	s
Chip Program (Quadruple Word/Octuple Byte Program)		10	50 <sup>(3)</sup>	s
Program Suspend Latency time			4	μs
Program/Erase Cycles (per Block)	100,000			cycles
Data Retention	20			years

1. Typical values measured at room temperature and nominal voltages.

2. Sampled, but not 100% tested.

3. Maximum value measured at worst case conditions for both temperature and  $V_{CC}$  after 100,00 program/erase cycles.

4. Maximum value measured at worst case conditions for both temperature and  $V_{CC}$ .

## 5 Status Register

Bus Read operations from any address always read the Status Register during Program and Erase operations. It is also read during Erase Suspend when an address within a block being erased is accessed.

The bits in the Status Register are summarized in [Table 9: Status Register Bits](#).

### 5.1 Data Polling Bit (DQ7)

The Data Polling Bit can be used to identify whether the Program/Erase Controller has successfully completed its operation or if it has responded to an Erase Suspend. The Data Polling Bit is output on DQ7 when the Status Register is read.

During Program operations the Data Polling Bit outputs the complement of the bit being programmed to DQ7. After successful completion of the Program operation the memory returns to Read mode and Bus Read operations from the address just programmed output DQ7, not its complement.

During Erase operations the Data Polling Bit outputs '0', the complement of the erased state of DQ7. After successful completion of the Erase operation the memory returns to Read Mode.

In Erase Suspend mode the Data Polling Bit will output a '1' during a Bus Read operation within a block being erased. The Data Polling Bit will change from a '0' to a '1' when the Program/Erase Controller has suspended the Erase operation.

[Figure 4: Data Polling flowchart](#), gives an example of how to use the Data Polling Bit. A Valid Address is the address being programmed or an address within the block being erased.

### 5.2 Toggle Bit (DQ6)

The Toggle Bit can be used to identify whether the Program/Erase Controller has successfully completed its operation or if it has responded to an Erase Suspend. The Toggle Bit is output on DQ6 when the Status Register is read.

During Program and Erase operations the Toggle Bit changes from '0' to '1' to '0', etc., with successive Bus Read operations at any address. After successful completion of the operation the memory returns to Read mode.

During Erase Suspend mode the Toggle Bit will output when addressing a cell within a block being erased. The Toggle Bit will stop toggling when the Program/Erase Controller has suspended the Erase operation.

[Figure 5: Data Toggle flowchart](#), gives an example of how to use the Data Toggle Bit.

### 5.3 Error Bit (DQ5)

The Error Bit can be used to identify errors detected by the Program/Erase Controller. The Error Bit is set to '1' when a Program, Block Erase or Chip Erase operation fails to write the correct data to the memory. If the Error Bit is set a Read/Reset command must be issued before other commands are issued. The Error bit is output on DQ5 when the Status Register is read.

Note that the Program command cannot change a bit set to '0' back to '1' and attempting to do so will set DQ5 to '1'. A Bus Read operation to that address will show the bit is still '0'. One of the Erase commands must be used to set all the bits in a block or in the whole memory from '0' to '1'.

### 5.4 Erase Timer Bit (DQ3)

The Erase Timer Bit can be used to identify the start of Program/Erase Controller operation during a Block Erase command. Once the Program/Erase Controller starts erasing the Erase Timer Bit is set to '1'. Before the Program/Erase Controller starts the Erase Timer Bit is set to '0' and additional blocks to be erased may be written to the Command Interface. The Erase Timer Bit is output on DQ3 when the Status Register is read.

### 5.5 Alternative Toggle Bit (DQ2)

The Alternative Toggle Bit can be used to monitor the Program/Erase controller during Erase operations. The Alternative Toggle Bit is output on DQ2 when the Status Register is read.

During Chip Erase and Block Erase operations the Toggle Bit changes from '0' to '1' to '0', etc., with successive Bus Read operations from addresses within the blocks being erased. A protected block is treated the same as a block not being erased. Once the operation completes the memory returns to Read mode.

During Erase Suspend the Alternative Toggle Bit changes from '0' to '1' to '0', etc. with successive Bus Read operations from addresses within the blocks being erased. Bus Read operations to addresses within blocks not being erased will output the memory cell data as if in Read mode.

After an Erase operation that causes the Error Bit to be set the Alternative Toggle Bit can be used to identify which block or blocks have caused the error. The Alternative Toggle Bit changes from '0' to '1' to '0', etc. with successive Bus Read Operations from addresses within blocks that have not erased correctly. The Alternative Toggle Bit does not change if the addressed block has erased correctly.

**Table 9. Status Register Bits<sup>(1)</sup>**

Operation	Address	DQ7	DQ6	DQ5	DQ3	DQ2	$\overline{RB}$
Program	Any address	$\overline{DQ7}$	Toggle	0	–	–	0
Program During Erase Suspend	Any address	$\overline{DQ7}$	Toggle	0	–	–	0
Program Error	Any address	$\overline{DQ7}$	Toggle	1	–	–	Hi-Z
Chip Erase	Any address	0	Toggle	0	1	Toggle	0
Block Erase before timeout	Erasing Block	0	Toggle	0	0	Toggle	0
	Non-Erasing Block	0	Toggle	0	0	No Toggle	0
Block Erase	Erasing Block	0	Toggle	0	1	Toggle	0
	Non-Erasing Block	0	Toggle	0	1	No Toggle	0
Erase Suspend	Erasing Block	1	No Toggle	0	–	Toggle	Hi-Z
	Non-Erasing Block	Data read as normal					Hi-Z
Erase Error	Good Block address	0	Toggle	1	1	No Toggle	Hi-Z
	Faulty Block address	0	Toggle	1	1	Toggle	Hi-Z

1. Unspecified data bits should be ignored.

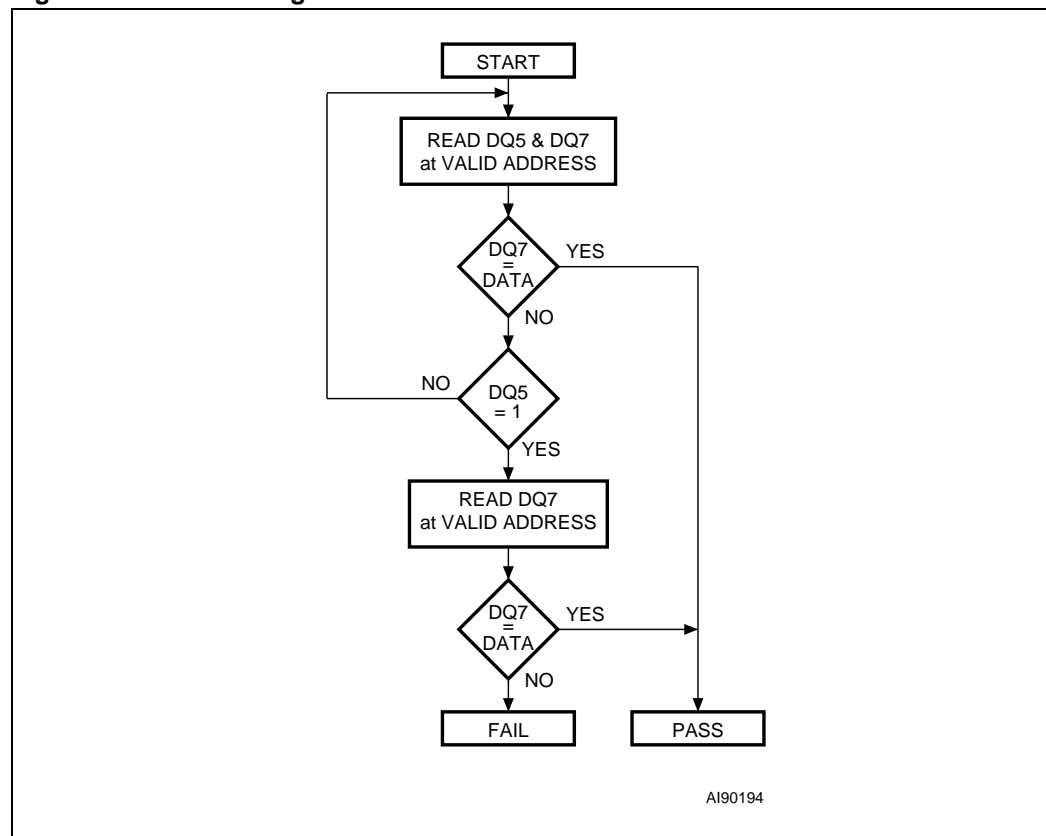

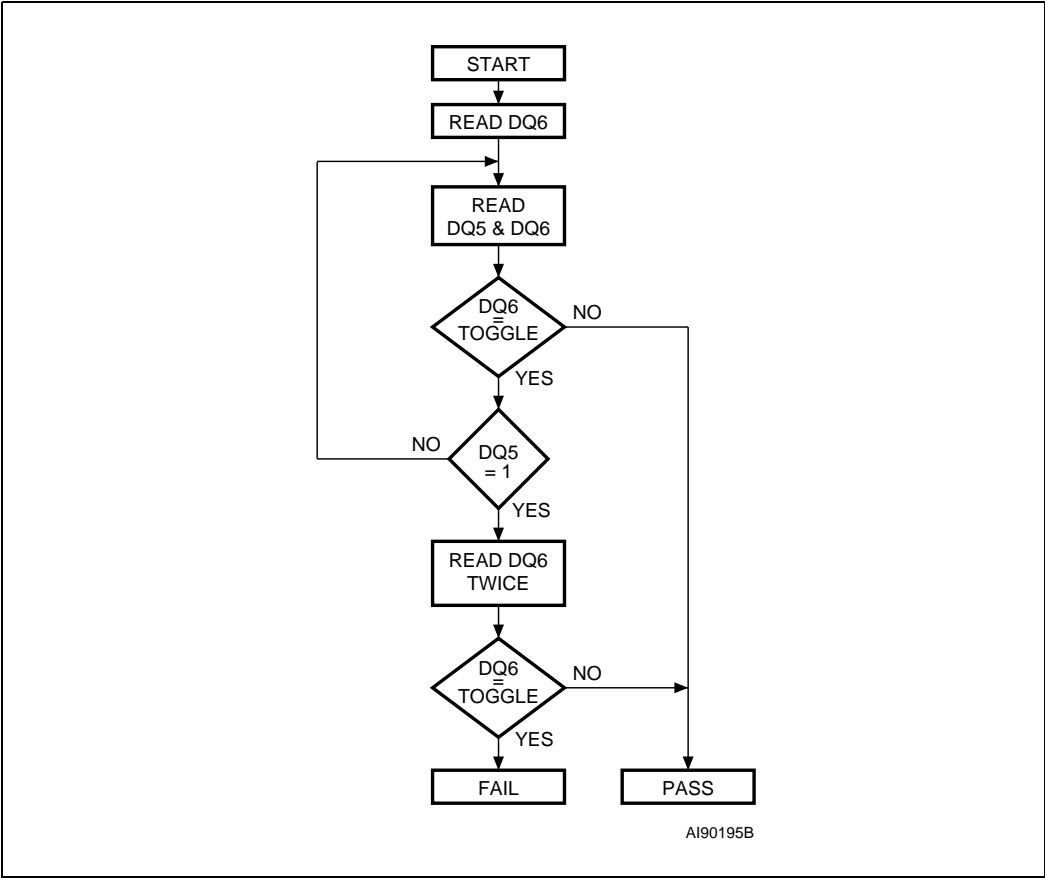

**Figure 4. Data Polling flowchart**

Figure 5. Data Toggle flowchart

## 6 Maximum rating

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Refer also to the Numonyx SURE Program and other relevant quality documents.

**Table 10. Absolute maximum ratings**

Symbol	Parameter	Min	Max	Unit
$T_{\text{BIAS}}$	Temperature under bias	−50	125	°C
$T_{\text{STG}}$	Storage temperature	−65	150	°C
$V_{\text{IO}}$	Input or Output voltage <sup>(1)(2)</sup>	−0.6	$V_{\text{CC}} + 0.6$	V
$V_{\text{CC}}$	Supply voltage	−0.6	4	V
$V_{\text{ID}}$	Identification voltage	−0.6	13.5	V
$V_{\text{PP}}^{(3)}$	Program voltage	−0.6	13.5	V

1. Minimum voltage may undershoot to −2V during transition and for less than 20ns during transitions.
2. Maximum voltage may overshoot to  $V_{\text{CC}} + 2\text{V}$  during transition and for less than 20ns during transitions.
3.  $V_{\text{PP}}$  must not remain at 12V for more than a total of 80hrs.

7 DC and AC parameters

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC Characteristic tables that follow are derived from tests performed under the Measurement Conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

Table 11. Operating and AC measurement conditions

Parameter	M29W640FT, M29W640FB		Unit
	Min	Max	
V <sub>CC</sub> Supply voltage	2.7	3.6	V
Ambient Operating Temperature	−40	85	°C
Load capacitance (C <sub>L</sub> )	30		pF
Input Rise and Fall times		10	ns
Input Pulse voltages	0 to V <sub>CC</sub>		V
Input and Output Timing Ref. voltages	V <sub>CC</sub> /2		V

Figure 6. AC measurement I/O waveform

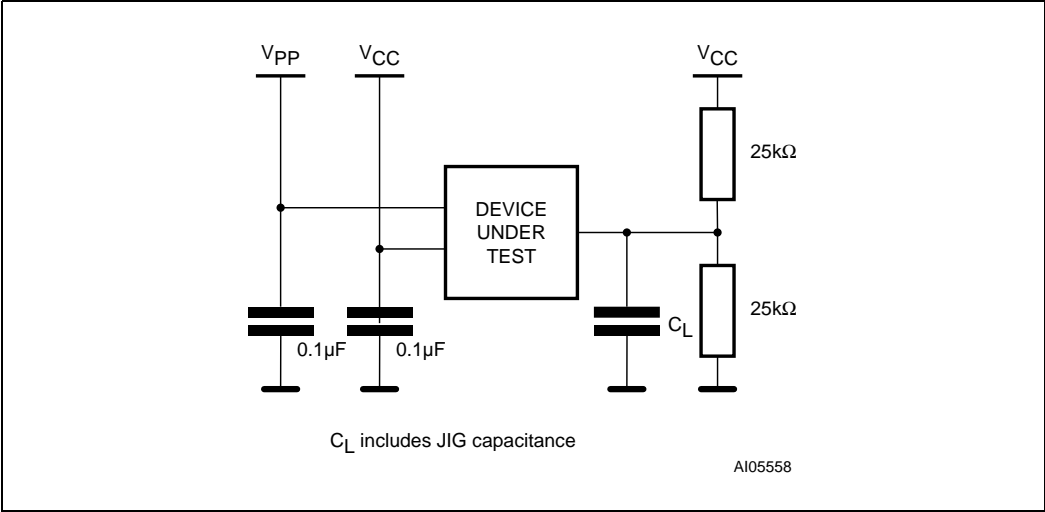

Figure 7. AC measurement Load Circuit

**Table 12. Device capacitance**

Symbol	Parameter	Test condition	Min	Max	Unit
$C_{IN}$	Input capacitance	$V_{IN} = 0V$		6	pF
$C_{OUT}$	Output capacitance	$V_{OUT} = 0V$		12	pF

1. Sampled only, not 100% tested.

**Table 13. DC characteristics**

Symbol	Parameter	Test condition	Min	Max	Unit
$I_{LI}$	Input Leakage Current	$0V \leq V_{IN} \leq V_{CC}$		$\pm 1$	$\mu A$
$I_{LO}$	Output Leakage Current	$0V \leq V_{OUT} \leq V_{CC}$		$\pm 1$	$\mu A$
$I_{CC1}$	Supply Current (Read)	$\bar{E} = V_{IL}, \bar{G} = V_{IH},$ $f = 6MHz$		10	mA
$I_{CC2}$	Supply Current (Standby)	$\bar{E} = V_{CC} \pm 0.2V,$ $\bar{RP} = V_{CC} \pm 0.2V$		100	$\mu A$
$I_{CC3}$	Supply Current (Program/Erase)	Program/Erase Controller active	$V_{PP}/\bar{WP} = V_{IL} \text{ or } V_{IH}$	20	mA
			$V_{PP}/\bar{WP} = V_{PP}$	20	mA
$V_{IL}$	Input Low voltage		-0.5	0.8	V
$V_{IH}$	Input High voltage		$0.7V_{CC}$	$V_{CC} + 0.3$	V
$V_{PP}$	Voltage for $V_{PP}/\bar{WP}$ Program Acceleration	$V_{CC} = 2.7V \pm 10\%$	11.5	12.5	V
$I_{PP}$	Current for $V_{PP}/\bar{WP}$ Program Acceleration	$V_{CC} = 2.7V \pm 10\%$		15	mA
$V_{OL}$	Output Low voltage	$I_{OL} = 1.8mA$		0.45	V
$V_{OH}$	Output High voltage	$I_{OH} = -100\mu A$	$V_{CC} - 0.4$		V
$V_{ID}$	Identification voltage		11.5	12.5	V
$V_{LKO}^{(1)}$	Program/Erase Lockout Supply voltage		1.8	2.3	V

1. Sampled only, not 100% tested.

1. Used as the Extended Block addresses in Extended Block mode.

## Appendix B Common Flash Interface (CFI)

The Common Flash Interface is a JEDEC approved, standardized data structure that can be read from the Flash memory device. It allows a system software to query the device to determine various electrical and timing parameters, density information and functions supported by the memory. The system can interface easily with the device, enabling the software to upgrade itself when necessary.

When the CFI Query Command is issued the device enters CFI Query mode and the data structure is read from the memory. Tables 23, 24, 25, 26, 27, and 28, show the addresses used to retrieve the data.

The CFI data structure also contains a security area where a 64 bit unique security number is written (see [Table 28: Security Code Area](#)). This area can be accessed only in Read mode by the final user. It is impossible to change the security number after it has been written by ST.

**Table 23. Query structure overview<sup>(1)</sup>**

Address		Sub-section name	Description
x16	x8		
10h	20h	CFI Query Identification String	Command set ID and algorithm data offset
1Bh	36h	System Interface Information	Device timing & voltage information
27h	4Eh	Device Geometry Definition	Flash device layout
40h	80h	Primary Algorithm-specific Extended Query table	Additional information specific to the Primary Algorithm (optional)
61h	C2h	Security Code Area	64 bit unique device number

1. Query data are always presented on the lowest order data outputs.

**Table 24. CFI Query Identification String<sup>(1)</sup>**

Address		Data	Description	Value
x16	x8			
10h	20h	0051h		"Q"
11h	22h	0052h	Query Unique ASCII String "QRY"	"R"
12h	24h	0059h		"Y"
13h	26h	0002h	Primary Algorithm Command Set and Control Interface ID code 16 bit ID code defining a specific algorithm	AMD Compatible
14h	28h	0000h		
15h	2Ah	0040h	Address for Primary Algorithm extended Query table (see <a href="#">Table 27</a> )	P = 40h
16h	2Ch	0000h		
17h	2Eh	0000h	Alternate Vendor Command Set and Control Interface ID Code second vendor - specified algorithm supported	NA
18h	30h	0000h		
19h	32h	0000h	Address for Alternate Algorithm extended Query table	NA
1Ah	34h	0000h		

1. Query data are always presented on the lowest order data outputs (DQ7-DQ0) only. DQ8-DQ15 are '0'.

**Table 25. CFI Query System Interface Information**

Address		Data	Description	Value
x16	x8			
1Bh	36h	0027h	V <sub>CC</sub> Logic Supply Minimum Program/Erase voltage bit 7 to 4BCD value in volts bit 3 to 0BCD value in 100 mV	2.7V
1Ch	38h	0036h	V <sub>CC</sub> Logic Supply Maximum Program/Erase voltage bit 7 to 4BCD value in volts bit 3 to 0BCD value in 100 mV	3.6V
1Dh	3Ah	00B5h	V <sub>PP</sub> [Programming] Supply Minimum Program/Erase voltage bit 7 to 4HEX value in volts bit 3 to 0BCD value in 100 mV	11.5V
1Eh	3Ch	00C5h	V <sub>PP</sub> [Programming] Supply Maximum Program/Erase voltage bit 7 to 4HEX value in volts bit 3 to 0BCD value in 100 mV	12.5V
1Fh	3Eh	0004h	Typical timeout per single byte/word program = 2 <sup>n</sup> μs	16μs
20h	40h	0000h	Typical timeout for minimum size write buffer program = 2 <sup>n</sup> μs	NA
21h	42h	000Ah	Typical timeout per individual Block Erase = 2 <sup>n</sup> ms	1s
22h	44h	0000h	Typical timeout for full Chip Erase = 2 <sup>n</sup> ms	NA
23h	46h	0004h	Maximum timeout for byte/word program = 2 <sup>n</sup> times typical	256μs
24h	48h	0000h	Maximum timeout for write buffer program = 2 <sup>n</sup> times typical	NA
25h	4Ah	0003h	Maximum timeout per individual Block Erase = 2 <sup>n</sup> times typical	8s
26h	4Ch	0000h	Maximum timeout for Chip Erase = 2 <sup>n</sup> times typical	NA

**Table 26. Device Geometry Definition<sup>(1)</sup>**

Address		Data	Description	Value
x16	x8			
27h	4Eh	0017h	Device Size = $2^n$ in number of bytes	8 MByte
28h 29h	50h 52h	0002h 0000h	Flash Device Interface Code description	x8, x16 Async.
2Ah 2Bh	54h 56h	0004h 0000h	Maximum number of bytes in multi-byte program or page = $2^n$	16 Bytes
2Ch	58h	0002h	Number of Erase Block Regions. It specifies the number of regions containing contiguous Erase Blocks of the same size.	2
2Dh 2Eh	5Ah 5Ch	0007h 0000h	Region 1 Information Number of Erase Blocks of identical size = 0007h+1	8
2Fh 30h	5Eh 60h	0020h 0000h	Region 1 Information Block size in Region 1 = 0020h * 256 byte	8Kbyte
31h 32h	62h 64h	007Eh 0000h	Region 2 Information Number of Erase Blocks of identical size= 007Eh+1	127
33h 34h	66h 68h	0000h 0001h	Region 2 Information Block size in Region 2 = 0100h * 256 byte	64Kbyte
35h 36h 37h 38h	6Ah 6Ch 6Eh 70h	0000h 0000h 0000h 0000h	Region 3 Information Number of Erase Blocks of identical size=007Fh+1 Region 3 Information Block size in Region 3 = 0000h * 256 byte	0 0
39h 3Ah 3Bh 3Ch	72h 74h 76h 78h	0000h 0000h 0000h 0000h	Region 4 Information Number of Erase Blocks of Identical size=007Fh+1 Region 4 Information Block size in Region 4 = 0000h * 256 byte	0 0

1. For Bottom Boot devices, Erase Block Region 1 is located from address 000000h to 007FFFh and Erase Block Region 2 from address 008000h to 3FFFFFFh.  
For Top Boot devices, Erase Block Region 1 is located from address 000000h to 3F7FFFh and Erase Block Region 2 from address 3F8000h to 3FFFFFFh.

**Table 27. Primary Algorithm-specific Extended Query table**

Address		Data	Description	Value
x16	x8

62h	C5h, C4h	XXXX	
63h	C7h, C6h	XXXX	
64h	C9h, C8h	XXXX	

## Appendix C Extended Memory Block

The M29W640F has an extra block, the Extended Block, that can be accessed using a dedicated command.

This Extended Block is 128 Words in x16 mode and 256 Bytes in x8 mode. It is used as a security block to provide a permanent security identification number) or to store additional information.

The Extended Block is either Factory Locked or Customer Lockable, its status is indicated by bit DQ7. This bit is permanently set to either '1' or '0' at the factory and cannot be changed. When set to '1', it indicates that the device is factory locked and the Extended Block is protected. When set to '0', it indicates that the device is customer lockable and the Extended Block is unprotected. Bit DQ7 being permanently locked to either '1' or '0' is another security feature which ensures that a customer lockable device cannot be used instead of a factory locked one.

Bit DQ7 is the most significant bit in the Extended Block Verify Code and a specific procedure must be followed to read it. See "Extended Memory Block Verify Code" in [Table 4: Bus operations, BYTE =  \$V\_{IL}\$](#)  and [Table 5: Bus operations, BYTE =  \$V\_{IH}\$](#) , for details of how to read bit DQ7.

The Extended Block can only be accessed when the device is in Extended Block mode. For details of how the Extended Block mode is entered and exited, refer to the [Section 4.3.1: Enter Extended Block command](#) and [Section 4.3.2: Exit Extended Block command](#), and to [Table 6](#) and [Table 7: Commands, 8-bit mode, BYTE =  \$V\_{IL}\$](#) .

### C.1 Factory Locked Extended Block

In devices where the Extended Block is factory locked, the Security Identification Number is written to the Extended Block address space (see [Table 29: Extended Block address and data](#)) in the factory. The DQ7 bit is set to '1' and the Extended Block cannot be unprotected.

### C.2 Customer Lockable Extended Block

A device where the Extended Block is customer lockable is delivered with the DQ7 bit set to '0' and the Extended Block unprotected. It is up to the customer to program and protect the Extended Block but care must be taken because the protection of the Extended Block is not reversible.

There are two ways of protecting the Extended Block:

- Issue the Enter Extended Block command to place the device in Extended Block mode, then use the In-System Technique with RP either at  $V_{IH}$  or at  $V_{ID}$  (refer to [Appendix D, Section D.2: In-System technique](#) and to the corresponding flowcharts, [Figure 18](#) and [Figure 19](#), for a detailed explanation of the technique).
- Issue the Enter Extended Block command to place the device in Extended Block mode, then use the Programmer Technique (refer to [Appendix D, Section D.1: Programmer technique](#) and to the corresponding flowcharts, [Figure 16](#) and [Figure 17](#), for a detailed explanation of the technique).

Once the Extended Block is programmed and protected, the Exit Extended Block command must be issued to exit the Extended Block mode and return the device to Read mode.

Table 29. Extended Block address and data

Address		Data	
x8	x16	Factory Locked	Customer Lockable
000000h-00007Fh	000000h-00003Fh	Security Identification Number	Determined by customer
000080h-0000FFh	000040h-00007Fh	Unavailable	

## Appendix D Block protection

Block protection can be used to prevent any operation from modifying the data stored in the memory. The blocks are protected in groups, refer to [Appendix A: Block addresses](#), [Table 21](#) and [Table 22](#) for details of the Protection Groups. Once protected, Program and Erase operations within the protected group fail to change the data.

There are three techniques that can be used to control Block Protection, these are the Programmer technique, the In-System technique and Temporary Unprotection. Temporary Unprotection is controlled by the Reset/Block Temporary Unprotection pin,  $\overline{RP}$ ; this is described in the Signal Descriptions section.

### D.1 Programmer technique

The Programmer technique uses high ( $V_{ID}$ ) voltage levels on some of the bus pins. These cannot be achieved using a standard microprocessor bus, therefore the technique is recommended only for use in Programming Equipment.

To protect a group of blocks follow the flowchart in [Figure 16: Programmer Equipment Group Protect flowchart](#). To unprotect the whole chip it is necessary to protect all of the groups first, then all groups can be unprotected at the same time. To unprotect the chip follow [Figure 17: Programmer Equipment Chip Unprotect flowchart](#). [Table 30: Programmer technique bus operations](#),  $BYTE = V_{IH}$  or  $V_{IL}$ , gives a summary of each operation.

The timing on these flowcharts is critical. Care should be taken to ensure that, where a pause is specified, it is followed as closely as possible. Do not abort the procedure before reaching the end. Chip Unprotect can take several seconds and a user message should be provided to show that the operation is progressing.

### D.2 In-System technique

The In-System technique requires a high voltage level on the Reset/Blocks Temporary Unprotect pin,  $\overline{RP}^{(1)}$ . This can be achieved without violating the maximum ratings of the components on the microprocessor bus, therefore this technique is suitable for use after the memory has been fitted to the system.

To protect a group of blocks follow the flowchart in [Figure 18: In-System Equipment Group Protect flowchart](#). To unprotect the whole chip it is necessary to protect all of the groups first, then all the groups can be unprotected at the same time. To unprotect the chip follow [Figure 19: In-System Equipment Chip Unprotect flowchart](#).

The timing on these flowcharts is critical. Care should be taken to ensure that, where a pause is specified, it is followed as closely as possible. Do not allow the microprocessor to service interrupts that will upset the timing and do not abort the procedure before reaching the end. Chip Unprotect can take several seconds and a user message should be provided to show that the operation is progressing.

**Note:**  $\overline{RP}$  can be either at  $V_{IH}$  or at  $V_{ID}$  when using the In-System Technique to protect the Extended Block.

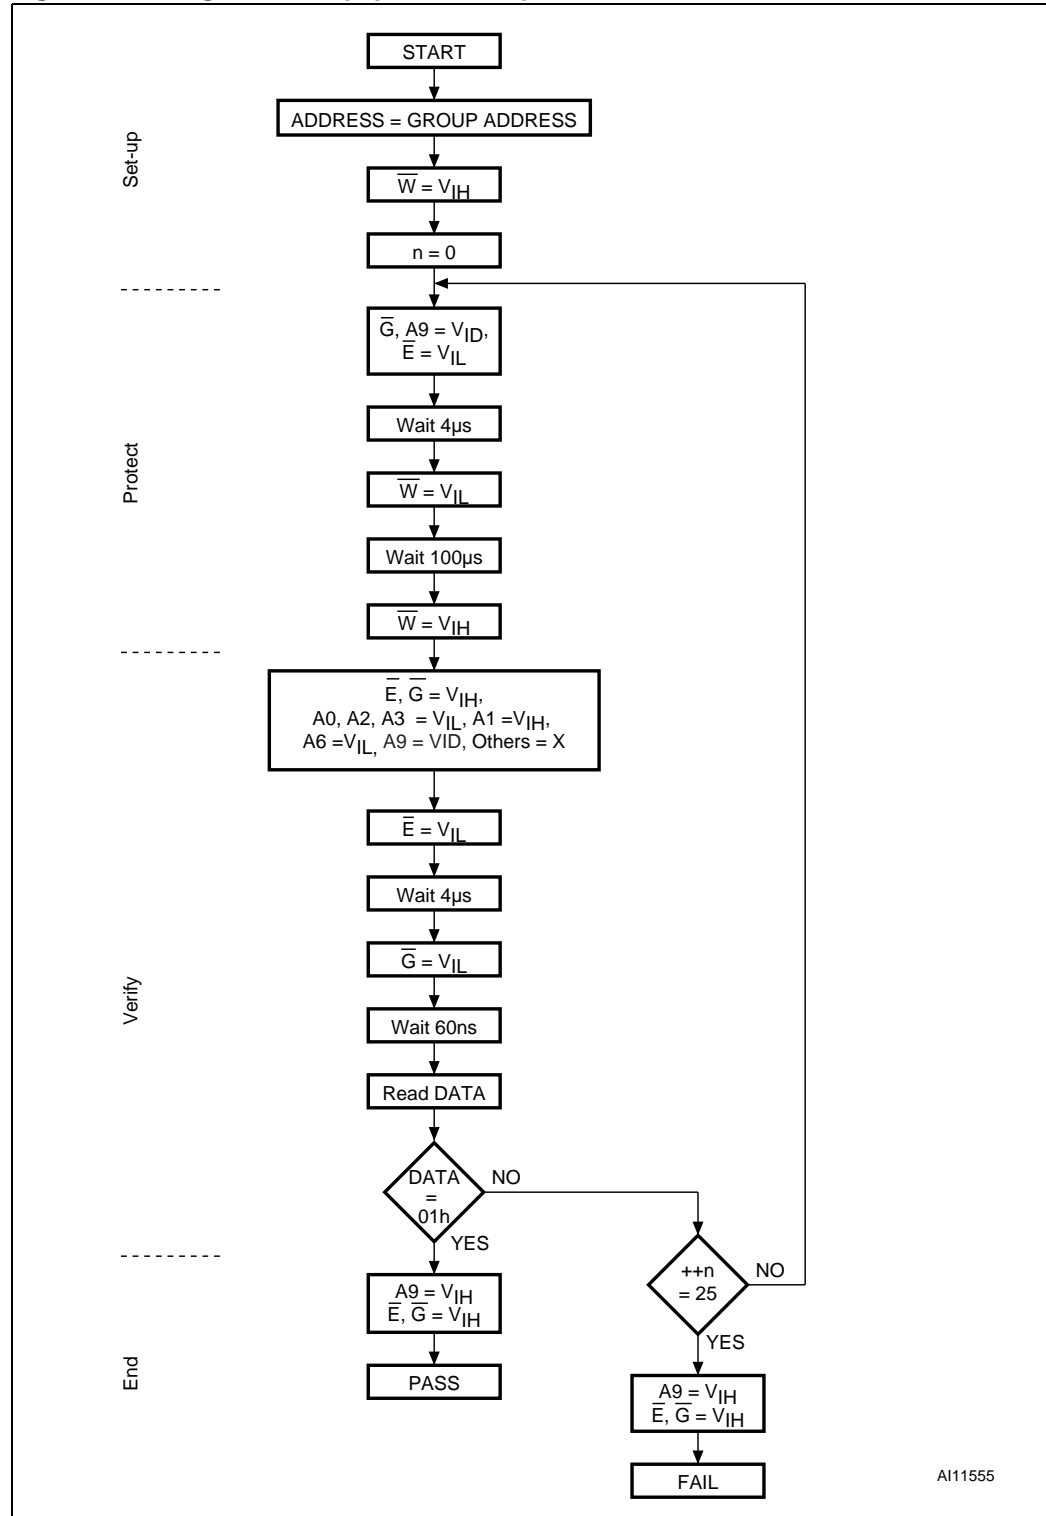

**Table 30. Programmer technique bus operations,  $\overline{\text{BYTE}} = V_{\text{IH}}$  or  $V_{\text{IL}}$** 

Operation	$\overline{\text{E}}$	$\overline{\text{G}}$	$\overline{\text{W}}$	Address Inputs A0-A21	Data Inputs/Outputs DQ15A-1, DQ14-DQ0
Block (Group) Protect <sup>(1)</sup>	$V_{\text{IL}}$	$V_{\text{ID}}$	$V_{\text{IL}}$ Pulse	A9 = $V_{\text{ID}}$ , A12-A21 = Block address Others = X	X
Chip Unprotect	$V_{\text{ID}}$	$V_{\text{ID}}$	$V_{\text{IL}}$ Pulse	A9 = $V_{\text{ID}}$ , A12 = $V_{\text{IH}}$ , A15 = $V_{\text{IH}}$ Others = X	X
Block (Group) Protection Verify	$V_{\text{IL}}$	$V_{\text{IL}}$	$V_{\text{IH}}$	A0, A2, A3 = $V_{\text{IL}}$ , A1 = $V_{\text{IH}}$ , A6 = $V_{\text{IL}}$ , A9 = $V_{\text{ID}}$ , A12-A21 = Block address Others = X	Pass = XX01h Retry = XX00h
Block (Group) Unprotection Verify	$V_{\text{IL}}$	$V_{\text{IL}}$	$V_{\text{IH}}$	A0, A2, A3 = $V_{\text{IL}}$ , A1 = $V_{\text{IH}}$ , A6 = $V_{\text{IH}}$ , A9 = $V_{\text{ID}}$ , A12-A21 = Block address Others = X	Retry = XX01h Pass = XX00h

## Revision history

**Table 31. Document revision history**

Date	Revision	Changes
01-Mar-2005	0.1	First Issue.
17-May-2005	0.2	Asynchronous Page mode added. 70ns speed class added.
07-Oct-2005	1.0	Device codes modified. TFBGA63 replaced by TFBGA48 6x8 package. ECOPACK text updated Page size changed to 4 Word. 90ns speed class removed. Quadruple Word/Octuple Byte Program command added. <a href="#">Table 4: Bus operations, BYTE = V<sub>IL</sub></a> and <a href="#">Table 5: Bus operations, BYTE = V<sub>IH</sub></a> : A0-A21 addresses for reading the Device Code, the Manufacturer Code, the Extended Memory Block Verify Code, and the Block Protection Status, have been updated. <a href="#">Appendix D: Block protection: Table 30: Programmer technique bus operations, BYTE = V<sub>IH</sub> or V<sub>IL</sub></a> : A0-A21 addresses updated for Block Protection/Unprotection Verify using the Programmer technique.
02-Dec-2005	2	Datasheet status changed to "Full Datasheet". 60ns speed class added. Program Suspend and Resume added. <a href="#">Section 2.8: V<sub>PP</sub>/Write Protect (V<sub>PP</sub>/WP)</a> and <a href="#">Section 4.2: Fast Program commands. Section 4: Command interface</a> restructured. <a href="#">Table 29: Extended Block address and data</a> updated.
15-Dec-2005	3	Double Byte Program commands added in <a href="#">Section 4: Command interface</a> . <a href="#">Table 4: Bus operations, BYTE = V<sub>IL</sub></a> and <a href="#">Table 5: Bus operations, BYTE = V<sub>IH</sub></a> : A6 changed from V <sub>IH</sub> to V <sub>IL</sub> for Read Block Protection Status operation.
10-Mar-2006	4	DQ7 changed to $\overline{\text{DQ7}}$ for Program, Program During Erase Suspend and Program Error in <a href="#">Table 9: Status Register Bits</a> . A6 = V <sub>IL</sub> corrected to A6 = V <sub>IH</sub> during the Verify phase in <a href="#">Figure 17: Programmer Equipment Chip Unprotect flowchart</a> . Address ranges modified for x8 and x16 modes in <a href="#">Table 29: Extended Block address and data</a> .
23-Aug-2006	5	Amended mistake in second title (M29W640FT changed to M29W640FB); removed the 4th cycle from the double byte program of <a href="#">Table 7: Commands, 8-bit mode, BYTE = V<sub>IL</sub></a>
25-Oct-2006	6	<a href="#">Table 9: Status Register Bits</a> updated.
10-Dec-2007	7	Applied Numonyx branding.
28-Aug-2008	8	Added clarifications regarding V <sub>PPH</sub> when performing Fast Program commands.
