MC10216

High Speed Triple Line Receiver

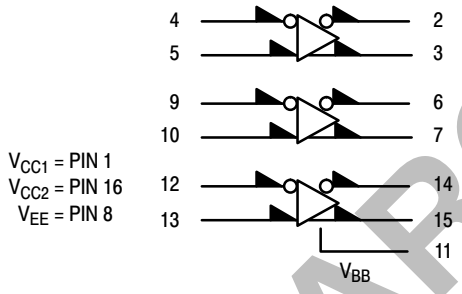
The MC10216 is a high speed triple differential amplifier designed for use in sensing differential signals over long lines. The base bias supply (V_{BB}) is made available at pin 11 to make the device useful as a Schmitt trigger, or in other applications where a stable reference voltage is necessary.

Active current sources provide the MC10216 with excellent common mode noise rejection. If any amplifier in a package is not used, one input of that amplifier must be connected to V_{BB} (pin 11) to prevent upsetting the current source bias network.

Complementary outputs are provided to allow driving twisted pair lines, to enable cascading of several amplifiers in a chain, or simply to provide complement outputs of the input logic function.

- P_D = 100 mW typ/pkg (No Load)
- t_{pd} = 1.8 ns typ (Single ended)
- = 1.5 ns typ (Differential)
- t_r, t_f = 1.5 ns typ (20%–80%)

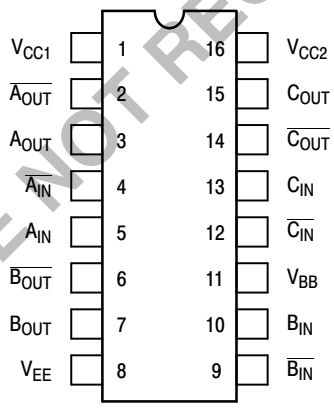
LOGIC DIAGRAM



*V_{BB} to be used to supply bias to the MC10216 only and bypassed (when used) with 0.01 μF to 0.1 μF capacitor.

When the input pin with bubble goes positive, it's respective output pin with bubble goes positive.

DIP PIN ASSIGNMENT



Pin assignment is for Dual–in–Line Package.
For PLCC pin assignment, see the Pin Conversion Tables on page 18 of the ON Semiconductor MECL Data Book (DL122/D).

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50–ohm resistor to –2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.
