

#### Features

- 2.5V or 3.3V operation
- 200-MHz clock support
- Two LVCMOS-/LVTTL-compatible inputs
- Ten clock outputs: drive up to 20 clock lines
- 1× or 1/2× configurable outputs
- Output three-state control
- 250-ps max. output-to-output skew
- Pin-compatible with MPC946, MPC9446
- Available in commercial and industrial temperature range
- 32-pin TQFP package

## Description

The CY29946 is a low-voltage 200-MHz clock distribution buffer with the capability to select one of two LVCMOS/LVTTL compatible input clocks. These clock sources can be used to provide for test clocks as well as the primary system clocks. All other control inputs are LVCMOS/LVTTL compatible. The 10 outputs are LVCMOS or LVTTL compatible and can drive  $50\Omega$  series or parallel terminated transmission lines. For series terminated transmission lines, each output can drive one or two traces giving the device an effective fanout of 1:20.

The CY29946 is capable of generating 1x and 1/2x signals from a 1x source. These signals are generated and retimed internally to ensure minimal skew between the 1x and 1/2x signals. SEL(A:C) inputs allow flexibility in selecting the ratio of 1x to 1/2x outputs.

The CY29946 outputs can also be three-stated via MR/OE# input. When MR/OE# is set HIGH, it resets the internal flip-flops and three-states the outputs.

## **Pin Description**<sup>[1]</sup>

| Pin                          | Name      | PWR  | I/O   | Description  |
|------------------------------|-----------|------|-------|--|
| 3, 4                         | TCLK(0,1) |      | I, PU | External Reference/Test Clock Input  |
| 26, 28, 30                   | QA(2:0)   | VDDC | 0     | Clock Outputs  |
| 19, 21, 23                   | QB(2:0)   | VDDC | 0     | Clock Outputs  |
| 10, 12, 14, 16               | QC(0:3)   | VDDC | 0     | Clock Outputs  |
| 5, 6, 7                      | DSEL(A:C) |      | I, PD | <b>Divider Select Inputs</b> . When HIGH, selects ÷2 input divider. When LOW, selects ÷1 input divider.  |
| 1                            | TCLK_SEL  |      | I, PD | <b>TCLK Select Input</b> . When LOW, TCLK0 clock is selected and when HIGH TCLK1 is selected.  |
| 32                           | MR/OE#    |      | I, PD | <b>Output Enable Input</b> . When asserted LOW, the outputs are enabled and when asserted HIGH, internal flip-flops are reset and the outputs are three-stated. If more than 1 Bank is being used in /2 Mode, a reset must be performed (MR/OE# Asserted High) after power-up to ensure all internal flip-flops are set to the same state. |
| 9, 13, 17, 18,<br>22, 25, 29 | VDDC      |      |       | 2.5V or 3.3V Power Supply for Output Clock Buffers   |
| 2                            | VDD       |      |       | 2.5V or 3.3V Power Supply  |
| 8, 11, 15, 20,<br>24, 27, 31 | VSS       |      |       | Common Ground  |

Note: 1. PD = Internal pull-down. PU = Internal pull-up.

## Absolute Maximum Conditions<sup>[2]</sup>

| Maximum Input Voltage Relative to $V_{SS}{:}\ldots\ldots$ , $V_{SS}{-}0.3V$ |
|---|
| Maximum Input Voltage Relative to V_DD: V_DD + 0.3V                         |
| Storage Temperature:65°C to + 150°C   |
| Operating Temperature:40°C to +85°C   |
| Maximum ESD protection2 kV  |
| Maximum Power Supply:5.5V   |
| Maximum Input Current:± 20 mA   |

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation,  $V_{in}$  and  $V_{out}$  should be constrained to the range:

 $V_{SS} < (V_{in} \text{ or } V_{out}) < V_{DD}$ .

Unused inputs must always be tied to an appropriate logic voltage level (either  $\rm V_{SS}~or~V_{DD}).$ 

#### **DC Electrical Specifications:** $V_{DD} = V_{DDC} = 3.3V \pm 10\%$ or 2.5V $\pm 5\%$ , over the specified temperature range

| Parameter        | Description                        | Conditions  | Min.            | Тур. | Max.            | Unit |

Notes:

2. Multiple Supplies: The voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.

3. Inputs have pull-up/pull-down resistors that effect input current.

4. Driving series or parallel terminated 50  $\Omega$  (or 50  $\Omega$  to V\_{DD}/2) transmission lines.

5. Parameters are guaranteed by design and characterization. Not 100% tested in production. All parameters specified with loaded outputs.

6. Outputs driving  $50\Omega$  transmission lines.

7. 50% input duty cycle.

8. See Figure 1.

9. Part-to-Part skew at a given temperature and voltage.
