

## Features

- Low-voltage operation
- $V_{DD} = 3.3V$
- 1:4 fanout
- Single input configurable for LVDS, LVPECL, or LVTTTL
- Four differential pairs of LVPECL outputs
- Drives 50-ohm load
- Low input capacitance
- Less than 4 ns typical propagation delay
- 85 ps typical output-to-output skew
- Industrial versions available
- Available in TSSOP package

## Description

The Cypress CY2 series of network circuits are produced using advanced 0.35-micron CMOS technology, achieving the industry's fastest logic.

The Cypress CY2DP814 fanout buffer features a single LVDS- or a single LVPECL-compatible input and four LVPECL output pairs.

Designed for data communications clock management applications, the fanout from a single input reduces loading on the input clock.

The CY2DP814 is ideal for both level translations from single-ended to LVPECL, and/or for the distribution of LVDS-based clock signals. The Cypress CY2DP814 has configurable input between logic families. The input can be selectable for an LVPECL, LVTTTL or LVDS signal, while the output drivers support LVPECL capable of driving 50-ohm lines.

**Notes**

- Stresses greater than those listed under absolute maximum ratings may cause permanent damage to the device. This is intended to be a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Multiple Supplies: The voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.

### Notes

- $V_{OC}$  measurement requires equipment with a 3-dB bandwidth of at least 300 MHz.
- All input pulses are supplied by a frequency generator with the following characteristics:  $t_R$  and  $t_F \leq 1$  ns; pulse re-rate = 50 Mpps; pulse width =  $10 \pm 0.2$  ns.
