

128K x 8 Static RAM

Features

- **Low voltage range:**
 - 2.7V–3.6V (CY62128V)
 - 2.3V–2.7V (CY62128V25)
 - 1.6V–2.0V (CY62128V18)
- **Low active power and standby power**
- **Easy memory expansion with \overline{CE} and \overline{OE} features**
- **TTL-compatible inputs and outputs**
- **Automatic power-down when deselected**
- **CMOS for optimum speed/power**

Functional Description

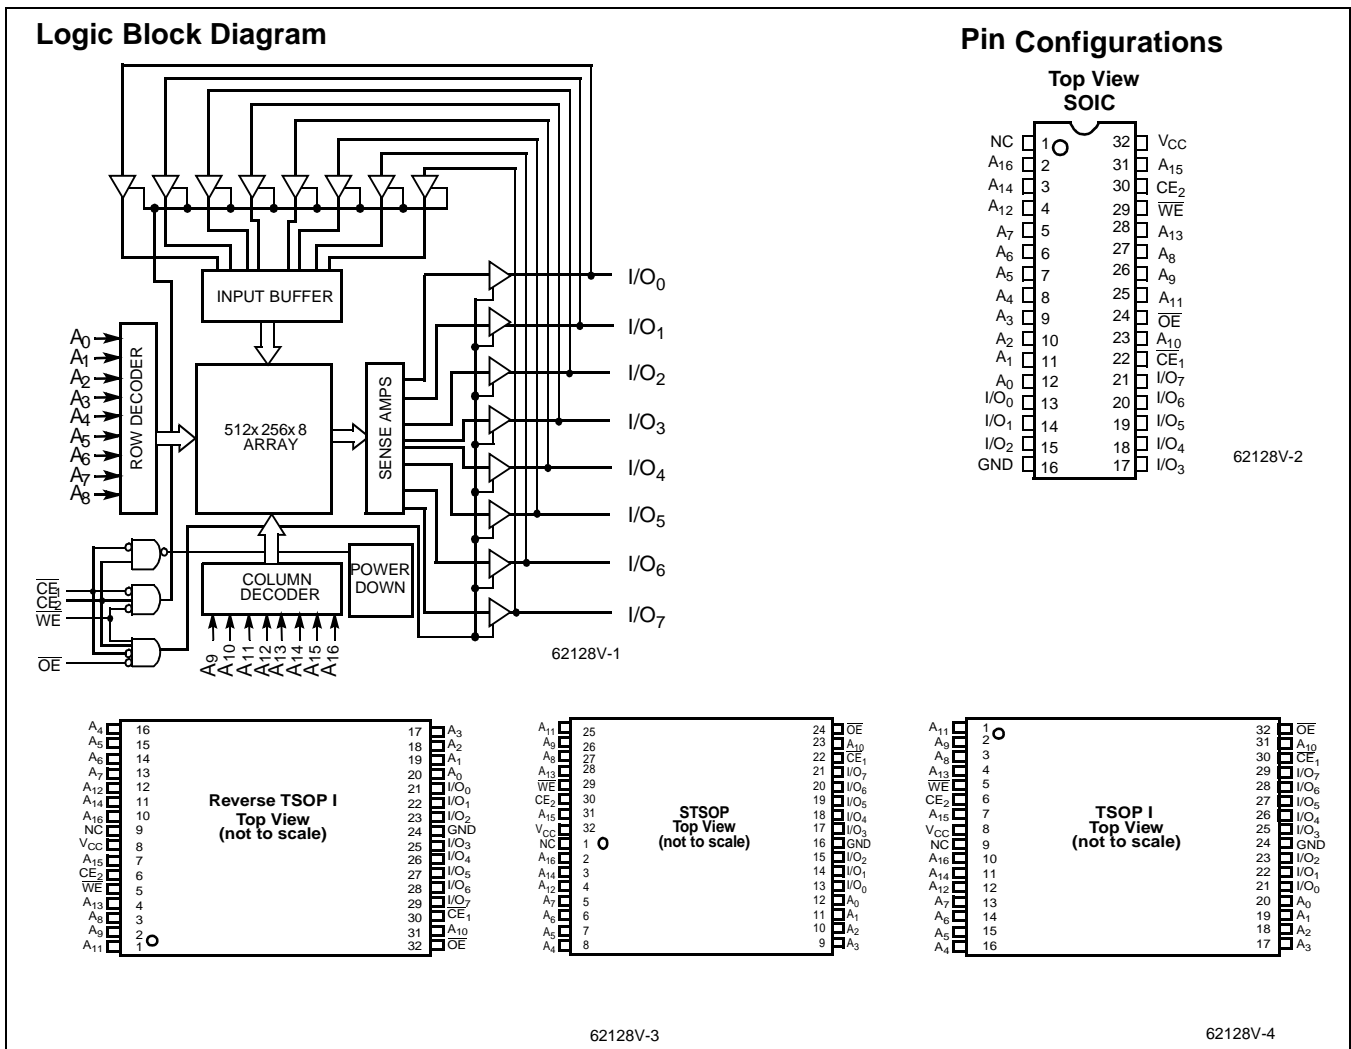

The CY62128V family is composed of three high-performance CMOS static RAMs organized as 131,072 words by 8 bits. Easy memory expansion is provided by an active LOW Chip Enable (\overline{CE}_1), an active HIGH Chip Enable (CE_2), an active

LOW Output Enable (\overline{OE}) and three-state drivers. These devices have an automatic power-down feature, reducing the power consumption by over 99% when deselected. The CY62128V family is available in the standard 450-mil-wide SOIC, 32-lead TSOP-I, and STSOP packages.

Writing to the device is accomplished by taking Chip Enable one (\overline{CE}_1) and Write Enable (\overline{WE}) inputs LOW and the Chip Enable two (CE_2) input HIGH. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{16}).

Reading from the device is accomplished by taking Chip Enable one (\overline{CE}_1) and Output Enable (\overline{OE}) LOW while forcing Write Enable (\overline{WE}) and Chip Enable two (CE_2) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input/output pins (I/O_0 through I/O_7) are placed in a high-impedance state when the device is deselected (\overline{CE}_1 HIGH or CE_2 LOW), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE}_1 LOW, CE_2 HIGH, and \overline{WE} LOW).

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature	-65°C to +150°C
Ambient Temperature with Power Applied	-55°C to +125°C
Supply Voltage to Ground Potential (Pin 28 to Pin 14)	-0.5V to +4.6V
DC Voltage Applied to Outputs in High Z State ^[1]	-0.5V to $V_{CC} + 0.5V$
DC Input Voltage ^[1]	-0.5V to $V_{CC} + 0.5V$

Output Current into Outputs (LOW)	20 mA
Static Discharge Voltage	>2001V (per MIL-STD-883, Method 3015)
Latch-Up Current	>200 mA

Operating Range

Range	Ambient Temperature	V_{CC}
Commercial	0°C to +70°C	1.6V to 3.6V
Industrial	-40°C to +85°C	1.6V to 3.6V

Product Portfolio

Product	V _{CC} Range			Speed	Power Dissipation (Commercial)			
	Min.	Typ. ^[2]	Max.		Operating (I _{CC})		Standby (I _{SB2})

t _{LZWE}	\overline{WE} HIGH to Low Z ^[6]	5		5		10		15		ns

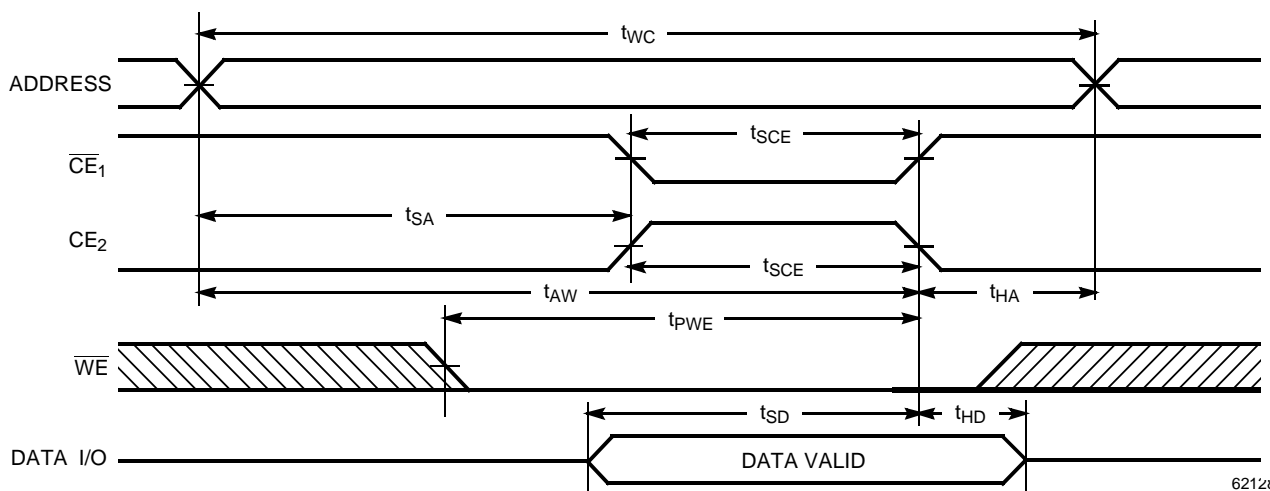

- Test conditions assume signal transition time of 5 ns or less timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 100-pF load capacitance.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any given device.
- t_{HZOE}, t_{HZCE}, and t_{HZWE} are specified with C_i = 5 pF as in part (b) of AC Test Loads. Transition is measured ±200 mV from steady-state voltage.
- The internal write time of the memory is defined by the overlap of CE₁ LOW, CE₂ HIGH, and WE LOW. CE₁ and WE signals must be LOW and CE₂ HIGH to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
- The minimum write cycle time for write cycle #3 (WE controlled, OE LOW) is the sum of t_{HZWE} and t_{SD}.

Switching Waveforms
Read Cycle No. 1^[10, 11]

62128V-8

Read Cycle No. 2 (\overline{OE} Controlled)^[11, 12]

62128V-9

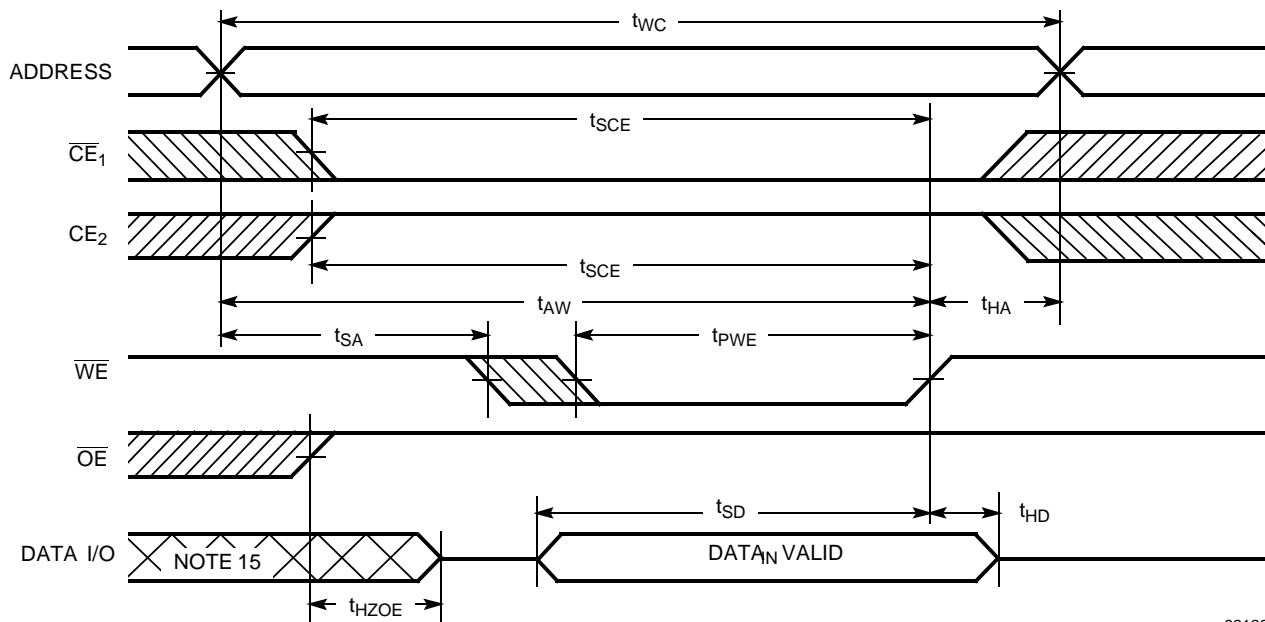

Write Cycle No. 1 (\overline{CE}_1 or CE_2 Controlled)^[13, 14]

62128V-10

Notes:

10. Device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$, $CE_2 = V_{IH}$.
11. \overline{WE} is HIGH for read cycle.
12. Address valid prior to or coincident with \overline{CE}_1 transition LOW and CE_2 transition HIGH.
13. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
14. If \overline{CE}_1 goes HIGH or CE_2 goes LOW simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.

Switching Waveforms (continued)

Write Cycle No. 2 (\overline{WE} Controlled, \overline{OE} HIGH During Write)^[13, 14]

62128V-11

Truth Table

\overline{CE}_1	CE_2	\overline{OE}	\overline{WE}	I/O ₀ -I/O ₇	Mode	Power
