36Mb SigmaCIO DDR-II Burst of 2 SRAM

167 MHz–333 MHz
1.8 V V_{DD}
1.8 V and 1.5 V I/O

Features

- Simultaneous Read and Write SigmaCIO™ Interface
- Common I/O bus
- JEDEC-standard pinout and package
- Double Data Rate interface
- Byte Write (x36, x18, and x9) and Nybble Write (x8) function
- Burst of 2 Read and Write
- 1.8 V +100/–100 mV core power supply
- 1.5 V or 1.8 V HSTL Interface
- Pipelined read operation with self-timed Late Write
- Fully coherent read and write pipelines
- ZQ pin for programmable output drive strength
- IEEE 1149.1 JTAG-compliant Boundary Scan
- 165-bump, 15 mm x 17 mm, 1 mm bump pitch BGA package
- RoHS-compliant 165-bump BGA package available
- Pin-compatible with present 9Mb and 18Mb and future 72Mb and 144Mb devices

SigmaCIO™ Family Overview

The GS8342T08/09/18/36AE are built in compliance with the SigmaCIO DDR-II SRAM pinout standard for Common I/O synchronous SRAMs. They are 37,748,736-bit (36Mb) SRAMs. The GS8342T08/09/18/36AE SigmaCIO SRAMs are just one element in a family of low power, low voltage HSTL I/O SRAMs designed to operate at the speeds needed to implement economical high performance networking systems.

Clocking and Addressing Schemes

The GS8342T08/09/18/36AE SigmaCIO DDR-II SRAMs are synchronous devices. They employ two input register clock inputs, K and $\overline{K}$. K and $\overline{K}$ are independent single-ended clock inputs, not differential inputs to a single differential clock input buffer. The device also allows the user to manipulate the output register clock inputs quasi independently with the C and C clock inputs. C and $\overline{C}$ are also independent single-ended clock inputs, not differential inputs. If the C clocks are tied high, the K clocks are routed internally to fire the output registers instead.

Common I/O x36 and x18 SigmaCIO DDR-II B2 RAMs always transfer data in two packets. When a new address is loaded, A0 presets an internal 1 bit address counter. The counter increments by 1 (toggles) for each beat of a burst of two data transfer.

Common I/O x8 SigmaCIO DDR-II B2 RAMs always transfer data in two packets. When a new address is loaded, the LSB is internally set to 0 for the first read or write transfer, and incremented by 1 for the next transfer. Because the LSB is tied off internally, the address field of a x8 SigmaCIO DDR-II B4 RAM is always one address pin less than the advertised index depth (e.g., the 8M x 8 has a 2M addressable index).

Parameter Synopsis

	-333	-300	-250	-200	-167
tKHKH	3.0 ns	3.3 ns	4.0 ns	5.0 ns	6.0 ns
tKHQV	0.45 ns	0.45 ns	0.45 ns	0.45 ns	0.5 ns

2. C, $\overline{C}$, K, or $\overline{K}$ cannot be set to V_{REF} voltage.

Background

Common I/O SRAMs, from a system architecture point of view, are attractive in read dominated or block transfer applications. Therefore, the SigmaCIO DDR-II SRAM interface and truth table are optimized for burst reads and writes. Common I/O SRAMs are unpopular in applications where alternating reads and writes are needed because bus turnaround delays can cut high speed Common I/O SRAM data bandwidth in half.

Burst Operations

Read and write operations are "burst" operations. In every case where a read or write command is accepted by the SRAM, it will respond by issuing or accepting two beats of data, executing a data transfer on subsequent rising edges of K and K#, as illustrated in the timing diagrams. It is not possible to stop a burst once it starts. Two beats of data are always transferred. This means that it is possible to load new addresses every K clock cycle. Addresses can be loaded less often, if intervening deselect cycles are inserted.

Deselect Cycles

Chip Deselect commands are pipelined to the same degree as read commands. This means that if a deselect command is applied to the SRAM on the next cycle after a read command captured by the SRAM, the device will complete the two beat read data transfer and then execute the deselect command, returning the output drivers to high-Z. A high on the LD# pin prevents the RAM from loading read or write command inputs and puts the RAM into deselect mode as soon as it completes all outstanding burst transfer operations.

SigmaCIO DDR-II B2 SRAM Read Cycles

The SRAM executes pipelined reads. The status of the Address, LD# and R/W# pins are evaluated on the rising edge of K. The read command (LD# low and R/W# high) is clocked into the SRAM by a rising edge of K. After the next rising edge of K, the SRAM produces data out in response to the next rising edge of C# (or the next rising edge of K#, if C and C# are tied high). The second beat of data is transferred on the next rising edge of C, for a total of two transfers per address load.

SigmaCIO DDR-II B2 SRAM Write Cycles

The status of the Address, LD# and R/W# pins are evaluated on the rising edge of K. The SRAM executes "late write" data transfers. Data in is due at the device inputs on the rising edge of K following the rising edge of K clock used to clock in the write command (LD# and R/W# low) and the write address. To complete the remaining beat of the burst of two write transfer, the SRAM captures data in on the next rising edge of K#, for a total of two transfers per address load.

Power-Up Sequence for SigmaQuad-II SRAMs

SigmaQuad-II SRAMs must be powered-up in a specific sequence in order to avoid undefined operations.

Power-Up Sequence

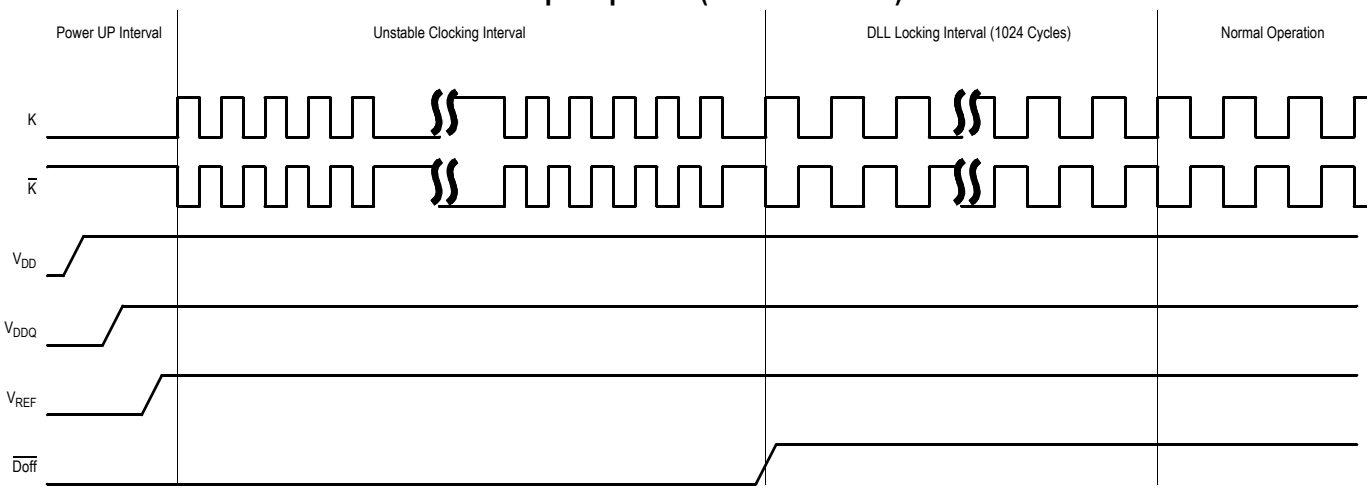
1. Power-up and maintain $\overline{\text{Doff}}$ at low state.
   - 1a. Apply V_{DD}.
   - 1b. Apply V_{DDQ}.
   - 1c. Apply V_{REF} (may also be applied at the same time as V_{DDQ}).
2. After power is achieved and clocks (K, $\overline{\text{K}}$, C, $\overline{\text{C}}$) are stablized, change $\overline{\text{Doff}}$ to high.
3. An additional 1024 clock cycles are required to lock the DLL after it has been enabled.

Note:
The DLL may be reset by driving the $\overline{\text{Doff}}$ pin low or by stopping the K clocks for at least 30 ns. 1024 cycles of clean K clocks are always required to re-lock the DLL after reset.

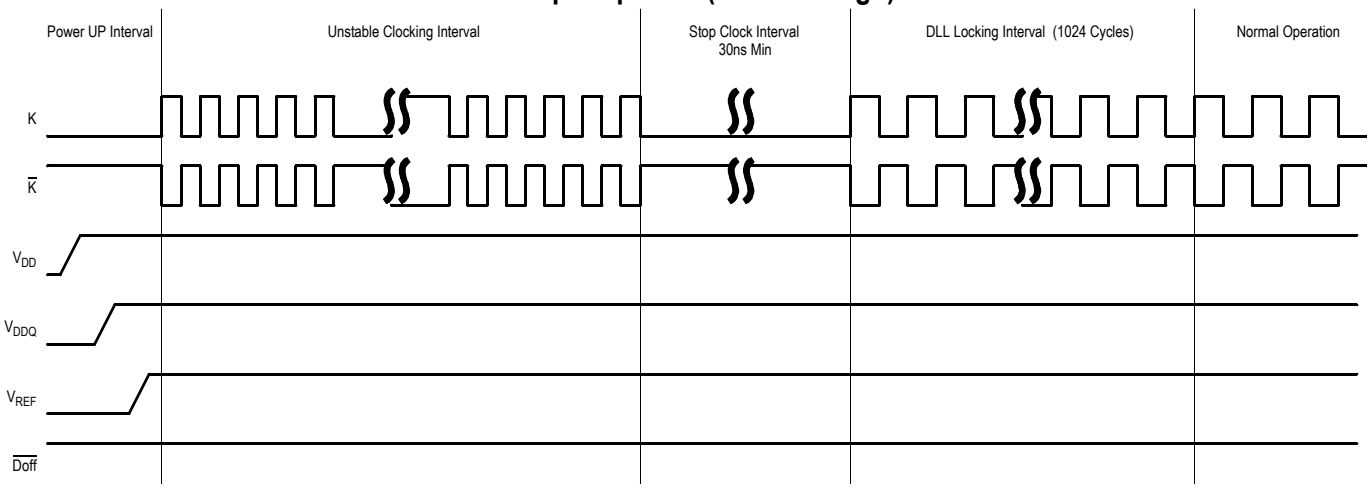
DLL Constraints

- The DLL synchronizes to either K or C clock. These clocks should have low phase jitter (t_{KCVar}).
- The DLL cannot operate at a frequency lower than that specified by the t_{KHKH} maximum specification for the desired operating clock frequency.
- If the incoming clock is not stablized when DLL is enabled, the DLL may lock on the wrong frequency and cause undefined errors or failures during the initial stage.

Power-Up Sequence ($\overline{\text{Doff}}$ controlled)



Power-Up Sequence ($\overline{\text{Doff}}$ tied High)



Note:
If the frequency is changed, DLL reset is required. After reset, a minimum of 1024 cycles is required for DLL lock.

Special Functions

Byte Write and Nybble Write Control

Byte Write Enable pins are sampled at the same time that Data In is sampled. A high on the Byte Write Enable pin associated with a particular byte (e.g., $\overline{BW0}$ controls D0–D8 inputs) will inhibit the storage of that particular byte, leaving whatever data may be stored at the current address at that byte location undisturbed. Any or all of the Byte Write Enable pins may be driven high or low during the data in sample times in a write sequence.

Each write enable command and write address loaded into the RAM provides the base address for a 2 beat data transfer. The x18 version of the RAM, for example, may write 36 bits in association with each address loaded. Any 9-bit byte may be masked in any write sequence.

Nybble Write (4-bit) write control is implemented on the 8-bit-wide version of the device. For the x8 version of the device, "Nybble Write Enable" and "$\overline{NBx}$" may be substituted in all the discussion above.

Example x18 RAM Write Sequence using Byte Write Enables

Data In Sample Time	$\overline{BW0}$	$\overline{BW1}$	D0–D8	D9–D17
Beat 1	0	1	Data In	Don't Care
Beat 2	1	0	Don't Care	Data In

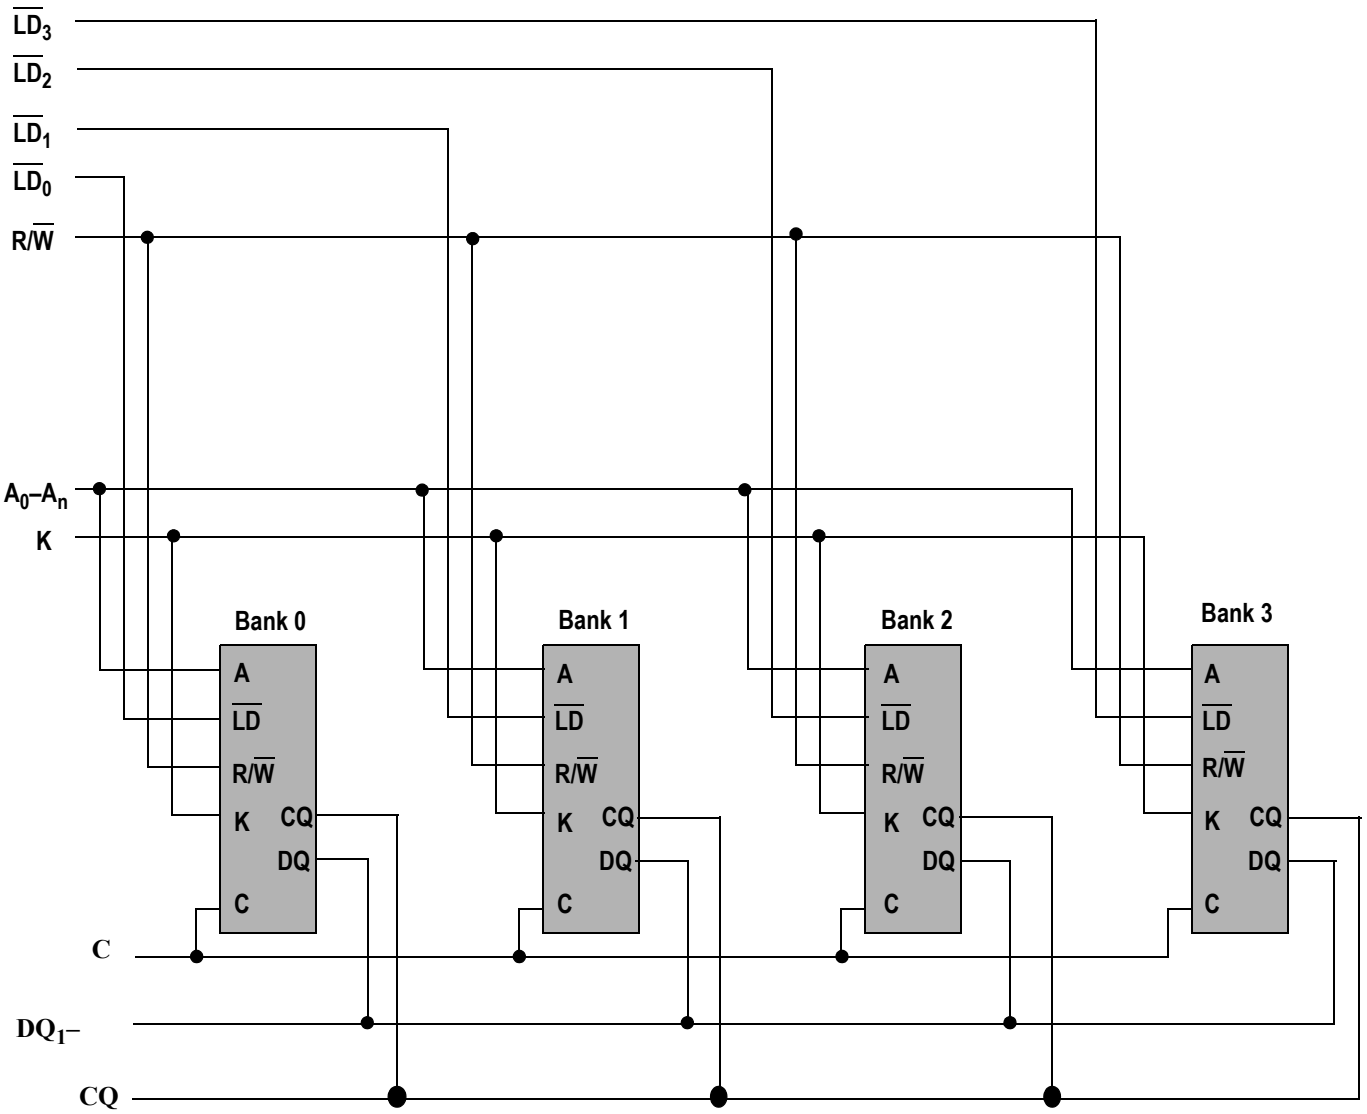
Resulting Write Operation

Byte 1 D0–D8	Byte 2 D9–D17	Byte 3 D0–D8	Byte 4 D9–D17
Written	Unchanged	Unchanged	Written
Beat 1		Beat 2	

Output Register Control

SigmaCIO DDR-II SRAMs offer two mechanisms for controlling the output data registers. Typically, control is handled by the Output Register Clock inputs, C and $\overline{C}$. The Output Register Clock inputs can be used to make small phase adjustments in the firing of the output registers by allowing the user to delay driving data out as much as a few nanoseconds beyond the next rising edges of the K and $\overline{K}$ clocks. If the C and $\overline{C}$ clock inputs isare tied high, the RAM reverts to K and $\overline{K}$ control of the outputs, allowing the RAM to function as a conventional pipelined read SRAM.

Example Four Bank Depth Expansion Schematic



Note:
For simplicity $\overline{BWn}$ (or $\overline{NWn}$), $\overline{K}$, and $\overline{C}$ are not shown.

FLXDrive-II Output Driver Impedance Control

HSTL I/O SigmaQuad-II SRAMs are supplied with programmable impedance output drivers. The ZQ pin must be connected to V_{SS} via an external resistor, RQ, to allow the SRAM to monitor and adjust its output driver impedance. The value of RQ must be 5X the value of the desired RAM output impedance. The allowable range of RQ to guarantee impedance matching continuously is between 175Ω and 350Ω. Periodic readjustment of the output driver impedance is necessary as the impedance is affected by drifts in supply voltage and temperature. The SRAM's output impedance circuitry compensates for drifts in supply voltage and temperature. A clock cycle counter periodically triggers an impedance evaluation, resets and counts again. Each impedance evaluation may move the output driver impedance level one step at a time towards the optimum level. The output driver is implemented with discrete binary weighted impedance steps.

Common I/O SigmaCIO DDR-II B2 SRAM Truth Table

K_n	$\overline{LD}$	R/$\overline{W}$	DQ		Operation
			A + 0	A + 1	
↑	1	X	Hi-Z	Hi-Z	Deselect
↑	0	0	D@K_{n+1}	D@$\overline{K}_{n+1}$	Write
↑	0	1	Q@$\overline{K}_{n+1}$ or $\overline{C}_{n+1}$	Q@K_{n+2} or C_{n+2}	Read

Note: Q is controlled by K clocks if C clocks are not used.

B2 Byte Write Clock Truth Table

$\overline{BW}$	$\overline{BW}$	Current Operation	D	D
K ↑ (t_{n+1})	K ↑ (t_{n+2})	K ↑ (t_n)	K ↑ (t_{n+1})	K ↑ (t_{n+2})
T	T	Write Dx stored if $\overline{BWn}$ = 0 in both data transfers	D1	D2
T	F	Write Dx stored if $\overline{BWn}$ = 0 in 1st data transfer only	D1	X
F	T	Write Dx stored if $\overline{BWn}$ = 0 in 2nd data transfer only	X	D2
F	F	Write Abort No Dx stored in either data transfer	X	X

Notes:
1. "1" = input "high"; "0" = input "low"; "X" = input "don't care"; "T" = input "true"; "F" = input "false".
2. If one or more $\overline{BWn}$ = 0, then $\overline{BW}$ = "T", else $\overline{BW}$ = "F".

*Assuming stable conditions, the RAM can achieve optimum impedance within 1024 cycles.

B2 Nybble Write Clock Truth Table

$\overline{NW}$	$\overline{NW}$	Current Operation	D	D
K ↑ (t_{n+1})	K ↑ (t_{n+2})	K ↑ (t_n)	K ↑ (t_{n+1})	K ↑ (t_{n+2})
T	T	Write Dx stored if $\overline{NWn}$ = 0 in both data transfers	D1	D2
T	F	Write Dx stored if $\overline{NWn}$ = 0 in 1st data transfer only	D1	X
F	T	Write Dx stored if $\overline{NWn}$ = 0 in 2nd data transfer only	X	D2
F	F	Write Abort No Dx stored in either data transfer	X	X

Notes:
1. "1" = input "high"; "0" = input "low"; "X" = input "don't care"; "T" = input "true"; "F" = input "false".
2. If one or more $\overline{NWn}$ = 0, then $\overline{NW}$ = "T", else $\overline{NW}$ = "F".

x36 Byte Write Enable ($\overline{BWn}$) Truth Table

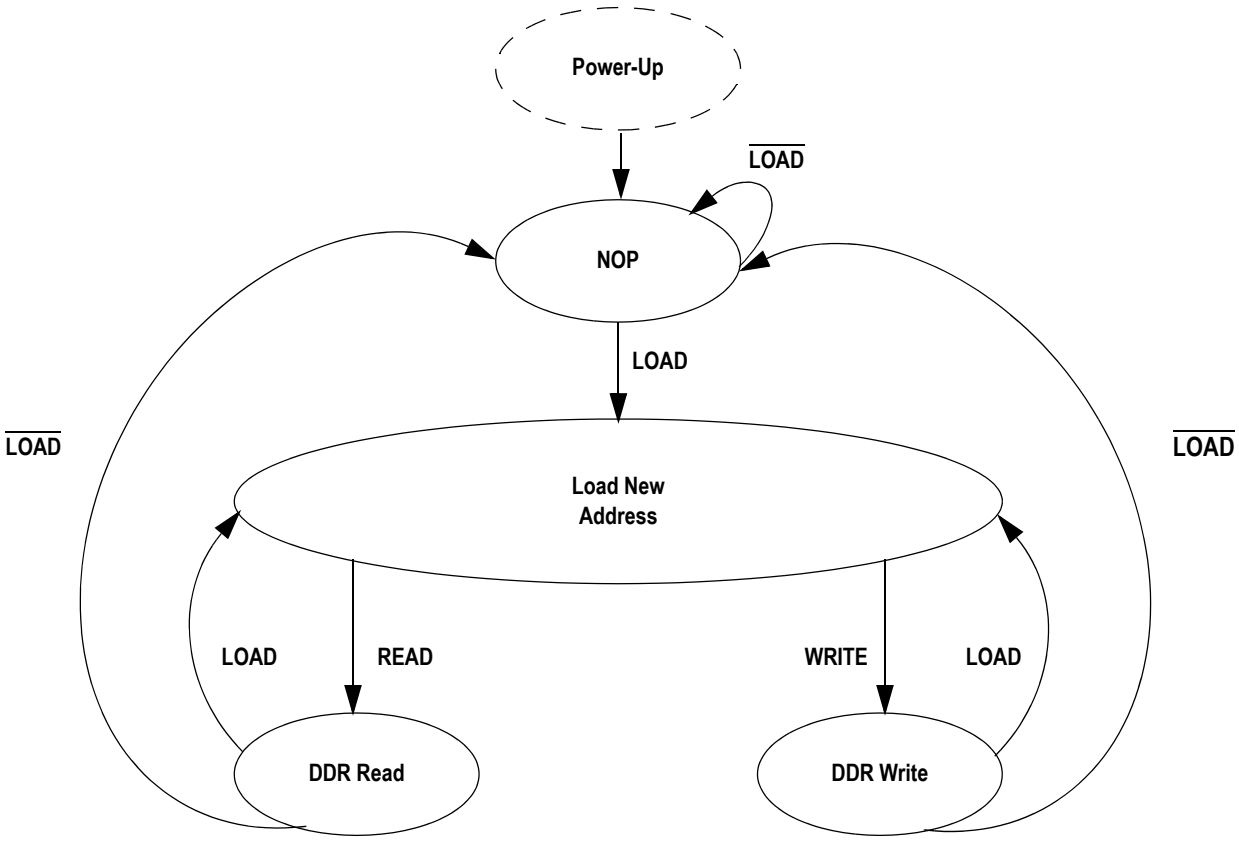
B2 State Diagram



Notes:

1. The internal address burst counter is a 1 bit counter (i.e., when first address is A0, next internal burst address is A0+1).
2. "READ" refers to read active status with R/$\overline{W}$ = High, "WRITE" refers to write inactive status with R/$\overline{W}$ = Low.
3. "LOAD" refers to read new address active status with $\overline{LD}$ = Low, "$\overline{LOAD}$" refers to read new address inactive status with $\overline{LD}$ = High.

Absolute Maximum Ratings

(All voltages reference to V_{SS})

Symbol	Description	Value	Unit
V_{DD}	Voltage on V_{DD} Pins	–0.5 to 2.9	V
V_{DDQ}	Voltage in V_{DDQ} Pins	–0.5 to V_{DD}	V
V_{REF}	Voltage in V_{REF} Pins	–0.5 to V_{DDQ}	V
$V_{I/O}$	Voltage on I/O Pins	–0.5 to V_{DDQ} +0.5 (≤ 2.9 V max.)	V
V_{IN}	Voltage on Other Input Pins	–0.5 to V_{DDQ} +0.5 (≤ 2.9 V max.)	V
I_{IN}	Input Current on Any Pin	+/–100	mA dc
I_{OUT}	Output Current on Any I/O Pin	+/–100	mA dc
T_J	Maximum Junction Temperature	125	°C
T_{STG}	Storage Temperature	–55 to 125	°C

Note:
Permanent damage to the device may occur if the Absolute Maximum Ratings are exceeded. Operation should be restricted to Recommended Operating Conditions. Exposure to conditions exceeding the Recommended Operating Conditions, for an extended period of time, may affect reliability of this component.

Recommended Operating Conditions

Power Supplies

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply Voltage	V_{DD}	1.7	1.8	1.9	V
I/O Supply Voltage	V_{DDQ}	1.4	—	1.9	V
Reference Voltage	V_{REF}	0.68	—	0.95	V

Notes:
1. Unless otherwise noted, all performance specifications quoted are evaluated for worst case at both 1.4 V ≤ V_{DDQ} ≤ 1.6 V (i.e., 1.5 V I/O) and 1.7 V ≤ V_{DDQ} ≤ 1.9 V (i.e., 1.8 V I/O) and quoted at whichever condition is worst case.
2. The power supplies need to be powered up simultaneously or in the following sequence: V_{DD}, V_{DDQ}, V_{REF}, followed by signal inputs. The power down sequence must be the reverse. V_{DDQ} must not exceed V_{DD}..

Operating Temperature

Parameter	Symbol	Min.	Typ.	Max.	Unit
Ambient Temperature (Commercial Range Versions)	T_A	0	25	70	°C
Ambient Temperature (Industrial Range Versions)	T_A	–40	25	85	°C

HSTL I/O DC Input Characteristics

Parameter	Symbol	Min	Max	Units	Notes
DC Input Logic High	V_{IH} (dc)	V_{REF} + 0.10	V_{DD} + 0.3 V	V	1
DC Input Logic Low	V_{IL} (dc)	–0.3 V	V_{REF} – 0.10	V	1

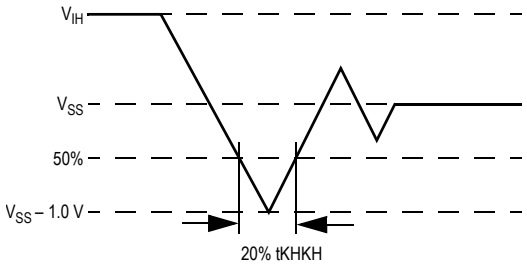
Notes:
1. Compatible with both 1.8 V and 1.5 V I/O drivers
2. These are DC test criteria. DC design criteria is V_{REF} ± 50 mV. The AC V_{IH}/V_{IL} levels are defined separately for measuring timing parameters.
3. V_{IL} (Min) DC = –0.3 V, V_{IL}(Min) AC = –1.5 V (pulse width ≤ 3 ns).
4. V_{IH} (Max) DC = V_{DDQ} + 0.3 V, V_{IH}(Max) AC = V_{DDQ} + 0.85 V (pulse width ≤ 3 ns).

HSTL I/O AC Input Characteristics

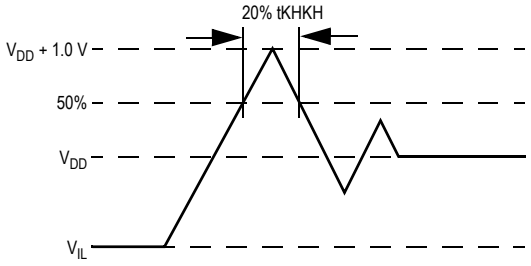
Parameter	Symbol	Min	Max	Units	Notes
AC Input Logic High	V_{IH} (ac)	V_{REF} + 0.20	—	V	3,4
AC Input Logic Low	V_{IL} (ac)	—	V_{REF} – 0.20	V	3,4
V_{REF} Peak to Peak AC Voltage	V_{REF} (ac)	—	5% V_{REF} (DC)	V	1

Notes:
1. The peak to peak AC component superimposed on V_{REF} may not exceed 5% of the DC component of V_{REF}.
2. To guarantee AC characteristics, V_{IH},V_{IL}, Trise, and Tfall of inputs and clocks must be within 10% of each other.
3. For devices supplied with HSTL I/O input buffers. Compatible with both 1.8 V and 1.5 V I/O drivers.

Undershoot Measurement and Timing



Overshoot Measurement and Timing



Capacitance

(T_A = 25°C, f = 1 MHz, V_{DD} = 3.3 V)

Parameter	Symbol	Test conditions	Typ.	Max.	Unit
Input Capacitance	C_{IN}	V_{IN} = 0 V	4	5	pF
Output Capacitance	C_{OUT}	V_{OUT} = 0 V	6	7	pF
Clock Capacitance	C_{CLK}	—	5	6	pF

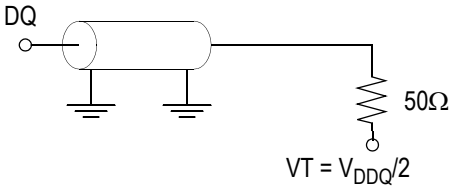
Note:
This parameter is sample tested.

AC Test Conditions

Parameter	Conditions
Input high level	V_{DDQ}
Input low level	0 V
Max. input slew rate	2 V/ns
Input reference level	$V_{DDQ}/2$
Output reference level	$V_{DDQ}/2$

Note:
Test conditions as specified with output loading as shown unless otherwise noted.

AC Test Load Diagram



RQ = 250 Ω (HSTL I/O)
V_{REF} = 0.75 V

Input and Output Leakage Characteristics

Parameter	Symbol	Test Conditions	Min.	Max	Notes
Input Leakage Current (except mode pins)	I_{IL}	V_{IN} = 0 to V_{DD}	–2 uA	2 uA	
$\overline{\text{Doff}}$	I_{INDOFF}	$V_{DD} \geq V_{IN} \geq V_{IL}$ 0 V ≤ $V_{IN} \leq V_{IL}$	–100 uA –2 uA	2 uA 2 uA	
Output Leakage Current	I_{OL}	Output Disable, V_{OUT} = 0 to V_{DDQ}	–2 uA	2 uA	

Programmable Impedance HSTL Output Driver DC Electrical Characteristics

Parameter	Symbol	Min.	Max.	Units	Notes
Output High Voltage	V_{OH1}	$V_{DDQ}/2$	V_{DDQ}	V	1, 3
Output Low Voltage	V_{OL1}	Vss	$V_{DDQ}/2$	V	2, 3
Output High Voltage	V_{OH2}	$V_{DDQ} - 0.2$	V_{DDQ}	V	4, 5
Output Low Voltage	V_{OL2}	Vss	0.2	V	4, 6

Notes:

1. $I_{OH} = (V_{DDQ}/2) / (RQ/5)$ +/– 15% @ $V_{OH} = V_{DDQ}/2$ (for: $175\Omega \le RQ \le 350\Omega$).
2. $I_{OL} = (V_{DDQ}/2) / (RQ/5)$ +/– 15% @ $V_{OL} = V_{DDQ}/2$ (for: $175\Omega \le RQ \le 350\Omega$).
3. Parameter tested with $RQ = 250\Omega$ and V_{DDQ} = 1.5 V or 1.8 V
4. $0\Omega \le RQ \le \infty\Omega$
5. I_{OH} = –1.0 mA
6. I_{OL} = 1.0 mA

Operating Currents

Parameter	Symbol	Test Conditions	-333		-300		-250		-200		-167		Notes
			0 to 70°C	–40 to 85°C	0 to 70°C	–40 to 85°C	0 to 70°C	–40 to 85°C	0 to 70°C	–40 to 85°C	0 to 70°C	–40 to 85°C

AC Electrical Characteristics (Continued)

Parameter	Symbol	-333		-300		-250		-200		-167		Units	Notes
		Min	Max	Min	Max	Min	Max	Min	Max	Min	Max		
Hold Times													
Address Input Hold Time	t_{KHAX}	0.4	—	0.4	—	0.5	—	0.6	—	0.7	—	ns	
Control Input Hold Time	t_{KHIX}	0.4	—	0.4	—	0.5	—	0.6	—	0.7	—	ns	
Data Input Hold Time	t_{KHDX}	0.28	—	0.3	—	0.35	—	0.4	—	0.5	—	ns	

Notes:

1. All Address inputs must meet the specified setup and hold times for all latching clock edges.
2. Control singles are $\overline{R}$, $\overline{W}$, $\overline{BW0}$, $\overline{BW1}$, and ($\overline{NW0}$, $\overline{NW1}$ for x8) and ($\overline{BW2}$, $\overline{BW3}$ for x36).
3. If C, $\overline{C}$ are tied high, K, $\overline{K}$ become the references for C, $\overline{C}$ timing parameters
4. To avoid bus contention, at a given voltage and temperature tCHQX1 is bigger than tCHQZ. The specs as shown do not imply bus contention because tCHQX1 is a MIN parameter that is worst case at totally different test conditions (0°C, 1.9 V) than tCHQZ, which is a MAX parameter (worst case at 70°C, 1.7 V). It is not possible for two SRAMs on the same board to be at such different voltages and temperatures.
5. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
6. V_{DD} slew rate must be less than 0.1 V DC per 50 ns for DLL lock retention. DLL lock time begins once V_{DD} and input clock are stable.
7. Echo clock is very tightly controlled to data valid/data hold. By design, there is a ±0.1 ns variation from echo clock to data. The datasheet parameters reflect tester guard bands and test setup variations.

JTAG Port Operation

Overview

The JTAG Port on this RAM operates in a manner that is compliant with IEEE Standard 1149.1-1990, a serial boundary scan interface standard (commonly referred to as JTAG). The JTAG Port input interface levels scale with V_{DD}. The JTAG output drivers are powered by V_{DDQ}.

Disabling the JTAG Port

It is possible to use this device without utilizing the JTAG port. The port is reset at power-up and will remain inactive unless clocked. TCK, TDI, and TMS are designed with internal pull-up circuits.To assure normal operation of the RAM with the JTAG Port unused, TCK, TDI, and TMS may be left floating or tied to either V_{DD} or V_{SS}. TDO should be left unconnected.

JTAG Pin Descriptions

Pin	Pin Name	I/O	Description
TCK	Test Clock	In	Clocks all TAP events. All inputs are captured on the rising edge of TCK and all outputs propagate from the falling edge of TCK.
TMS	Test Mode Select	In	The TMS input is sampled on the rising edge of TCK. This is the command input for the TAP controller state machine. An undriven TMS input will produce the same result as a logic one input level.
TDI	Test Data In	In	The TDI input is sampled on the rising edge of TCK. This is the input side of the serial registers placed between TDI and TDO. The register placed between TDI and TDO is determined by the state of the TAP Controller state machine and the instruction that is currently loaded in the TAP Instruction Register (refer to the TAP Controller State Diagram). An undriven TDI pin will produce the same result as a logic one input level.
TDO	Test Data Out	Out	Output that is active depending on the state of the TAP state machine. Output changes in response to the falling edge of TCK. This is the output side of the serial registers placed between TDI and TDO.

Note:
This device does not have a TRST (TAP Reset) pin. TRST is optional in IEEE 1149.1. The Test-Logic-Reset state is entered while TMS is held high for five rising edges of TCK. The TAP Controller is also reset automaticly at power-up.

JTAG Port Registers

Overview

The various JTAG registers, refered to as Test Access Port orTAP Registers, are selected (one at a time) via the sequences of 1s and 0s applied to TMS as TCK is strobed. Each of the TAP Registers is a serial shift register that captures serial input data on the rising edge of TCK and pushes serial data out on the next falling edge of TCK. When a register is selected, it is placed between the TDI and TDO pins.

Instruction Register

The Instruction Register holds the instructions that are executed by the TAP controller when it is moved into the Run, Test/Idle, or the various data register states. Instructions are 3 bits long. The Instruction Register can be loaded when it is placed between the TDI and TDO pins. The Instruction Register is automatically preloaded with the IDCODE instruction at power-up or whenever the controller is placed in Test-Logic-Reset state.

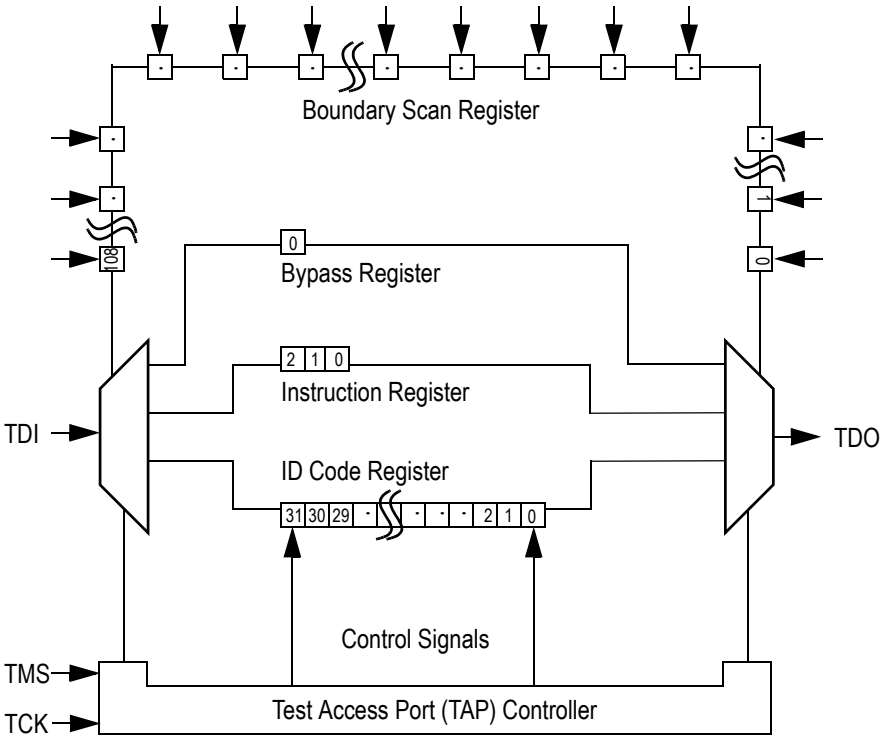
Bypass Register

The Bypass Register is a single bit register that can be placed between TDI and TDO. It allows serial test data to be passed through the RAM's JTAG Port to another device in the scan chain with as little delay as possible.

Boundary Scan Register

The Boundary Scan Register is a collection of flip flops that can be preset by the logic level found on the RAM's input or I/O pins. The flip flops are then daisy chained together so the levels found can be shifted serially out of the JTAG Port's TDO pin. The Boundary Scan Register also includes a number of place holder flip flops (always set to a logic 1). The relationship between the device pins and the bits in the Boundary Scan Register is described in the Scan Order Table following. The Boundary Scan Register, under the control of the TAP Controller, is loaded with the contents of the RAMs I/O ring when the controller is in Capture-DR state and then is placed between the TDI and TDO pins when the controller is moved to Shift-DR state. SAMPLE-Z, SAMPLE/PRELOAD and EXTEST instructions can be used to activate the Boundary Scan Register.

JTAG TAP Block Diagram



Identification (ID) Register

The ID Register is a 32-bit register that is loaded with a device and vendor specific 32-bit code when the controller is put in Capture-DR state with the IDCODE command loaded in the Instruction Register. The code is loaded from a 32-bit on-chip ROM. It describes various attributes of the RAM as indicated below. The register is then placed between the TDI and TDO pins when the controller is moved into Shift-DR state. Bit 0 in the register is the LSB and the first to reach TDO when shifting begins.

ID Register Contents

	Not Used																			GSI Technology JEDEC Vendor ID Code										Presence Register
Bit #	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	0	0	0	1	1	0	1	1	0	0	1	1

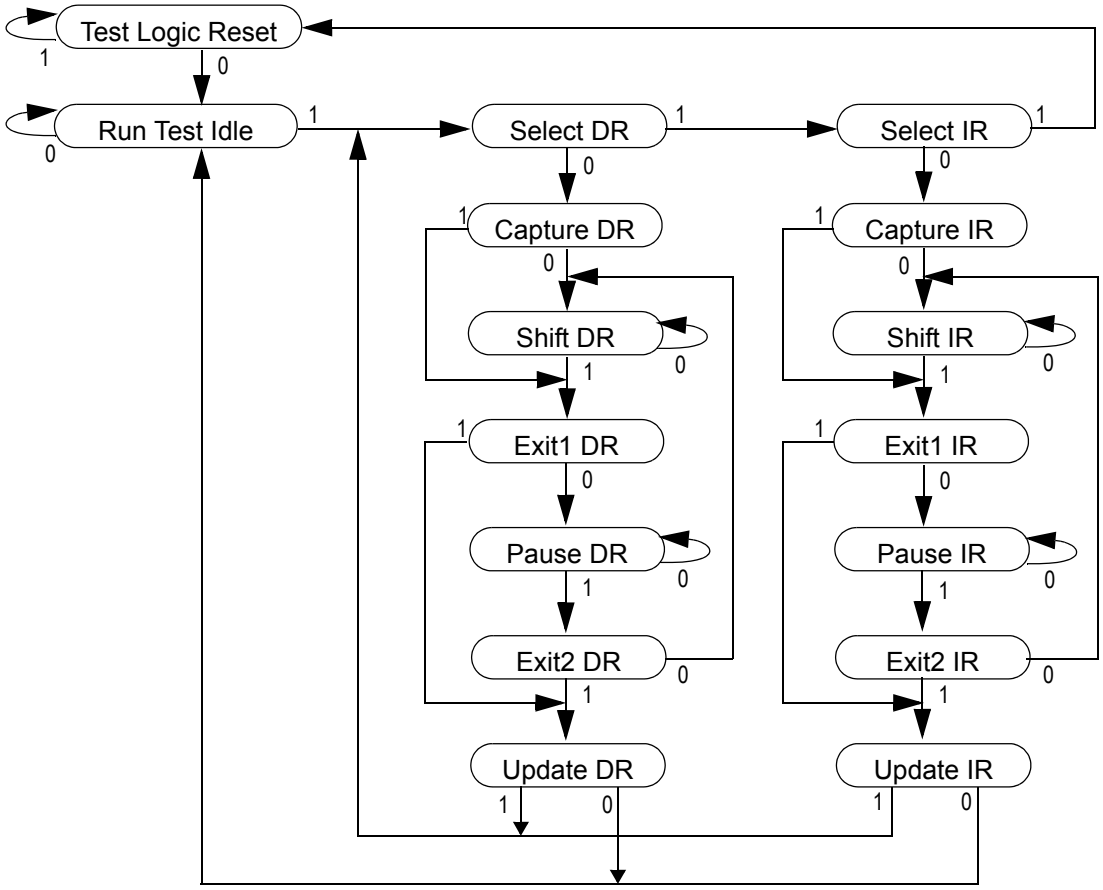
Tap Controller Instruction Set

Overview

There are two classes of instructions defined in the Standard 1149.1-1990; the standard (Public) instructions, and device specific (Private) instructions. Some Public instructions are mandatory for 1149.1 compliance. Optional Public instructions must be implemented in prescribed ways. The TAP on this device may be used to monitor all input and I/O pads, and can be used to load address, data or control signals into the RAM or to preload the I/O buffers.

When the TAP controller is placed in Capture-IR state the two least significant bits of the instruction register are loaded with 01. When the controller is moved to the Shift-IR state the Instruction Register is placed between TDI and TDO. In this state the desired instruction is serially loaded through the TDI input (while the previous contents are shifted out at TDO). For all instructions, the TAP executes newly loaded instructions only when the controller is moved to Update-IR state. The TAP instruction set for this device is listed in the following table.

JTAG Tap Controller State Diagram



Instruction Descriptions

BYPASS

When the BYPASS instruction is loaded in the Instruction Register the Bypass Register is placed between TDI and TDO. This occurs when the TAP controller is moved to the Shift-DR state. This allows the board level scan path to be shortened to facilitate testing of other devices in the scan path.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is a Standard 1149.1 mandatory public instruction. When the SAMPLE / PRELOAD instruction is loaded in the Instruction Register, moving the TAP controller into the Capture-DR state loads the data in the RAMs input and I/O buffers into the Boundary Scan Register. Boundary Scan Register locations are not associated with an input or I/O pin, and are loaded with the default state identified in the Boundary Scan Chain table at the end of this section of the datasheet. Because the RAM clock is independent from the TAP Clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while the input buffers are in transition (i.e. in a metastable state). Although allowing the TAP to sample metastable inputs will not harm the device, repeatable results cannot be expected. RAM input signals must be stabilized for long enough to meet the TAPs input data capture set-up plus hold time (tTS plus tTH). The RAMs clock inputs need not be paused for any other TAP operation except capturing the I/O ring contents into the Boundary Scan Register. Moving the controller to Shift-DR state then places the boundary scan register between the TDI and TDO pins.

EXTEST

EXTEST is an IEEE 1149.1 mandatory public instruction. It is to be executed whenever the instruction register is loaded with all logic 0s. The EXTEST command does not block or override the RAM's input pins; therefore, the RAM's internal state is still determined by its input pins.

Typically, the Boundary Scan Register is loaded with the desired pattern of data with the SAMPLE/PRELOAD command. Then the EXTEST command is used to output the Boundary Scan Register's contents, in parallel, on the RAM's data output drivers on the falling edge of TCK when the controller is in the Update-IR state.

Alternately, the Boundary Scan Register may be loaded in parallel using the EXTEST command. When the EXTEST instruction is selected, the sate of all the RAM's input and I/O pins, as well as the default values at Scan Register locations not associated with a pin, are transferred in parallel into the Boundary Scan Register on the rising edge of TCK in the Capture-DR state, the RAM's output pins drive out the value of the Boundary Scan Register location with which each output pin is associated.

IDCODE

The IDCODE instruction causes the ID ROM to be loaded into the ID register when the controller is in Capture-DR mode and places the ID register between the TDI and TDO pins in Shift-DR mode. The IDCODE instruction is the default instruction loaded in at power up and any time the controller is placed in the Test-Logic-Reset state.

SAMPLE-Z

If the SAMPLE-Z instruction is loaded in the instruction register, all RAM outputs are forced to an inactive drive state (high-Z) and the Boundary Scan Register is connected between TDI and TDO when the TAP controller is moved to the Shift-DR state.

RFU

These instructions are Reserved for Future Use. In this device they replicate the BYPASS instruction.

JTAG TAP Instruction Set Summary

Instruction	Code	Description	Notes
EXTEST	000	Places the Boundary Scan Register between TDI and TDO.	1
IDCODE	001	Preloads ID Register and places it between TDI and TDO.	1, 2
SAMPLE-Z	010	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO. Forces all RAM output drivers to High-Z except CQ.	1
RFU	011	Do not use this instruction; Reserved for Future Use. Replicates BYPASS instruction. Places Bypass Register between TDI and TDO.	1
SAMPLE/ PRELOAD	100	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO.	1
GSI	101	GSI private instruction.	1
RFU	110	Do not use this instruction; Reserved for Future Use. Replicates BYPASS instruction. Places Bypass Register between TDI and TDO.	1
BYPASS	111	Places Bypass Register between TDI and TDO.	1

Notes:

1. Instruction codes expressed in binary, MSB on left, LSB on right.
2. Default instruction automatically loaded at power-up and in test-logic-reset state.

JTAG Port Recommended Operating Conditions and DC Characteristics

Parameter	Symbol	Min.	Max.	Unit	Notes
Test Port Input Low Voltage	V_{ILJ}	–0.3	0.3 * V_{DD}	V	1
Test Port Input High Voltage	V_{IHJ}	0.6 * V_{DD}	V_{DD} +0.3	V	1
TMS, TCK and TDI Input Leakage Current	I_{INHJ}	–300	1	uA	2
TMS, TCK and TDI Input Leakage Current	I_{INLJ}	–1	100	uA	3
TDO Output Leakage Current	I_{OLJ}	–1	1	uA	4
Test Port Output High Voltage	V_{OHJ}	V_{DD} – 200 mV	—	V	5, 6
Test Port Output Low Voltage	V_{OLJ}	—	0.4	V	5, 7
Test Port Output CMOS High	V_{OHJC}	V_{DD} – 100 mV	—	V	5, 8
Test Port Output CMOS Low	V_{OLJC}	—	100 mV	V	5, 9

Notes:

1. Input Under/overshoot voltage must be –1 V < Vi < V_{DDn} +1 V not to exceed 2.9 V maximum, with a pulse width not to exceed 20% tTKC.
2. $V_{ILJ} \leq V_{IN} \leq V_{DDn}$
3. $0\ V \leq V_{IN} \leq V_{ILJn}$
4. Output Disable, V_{OUT} = 0 to V_{DDn}
5. The TDO output driver is served by the V_{DD} supply.
6. I_{OHJ} = –2 mA
7. I_{OLJ} = + 2 mA
8. I_{OHJC} = –100 uA
9. I_{OLJC} = +100 uA

JTAG Port AC Test Conditions

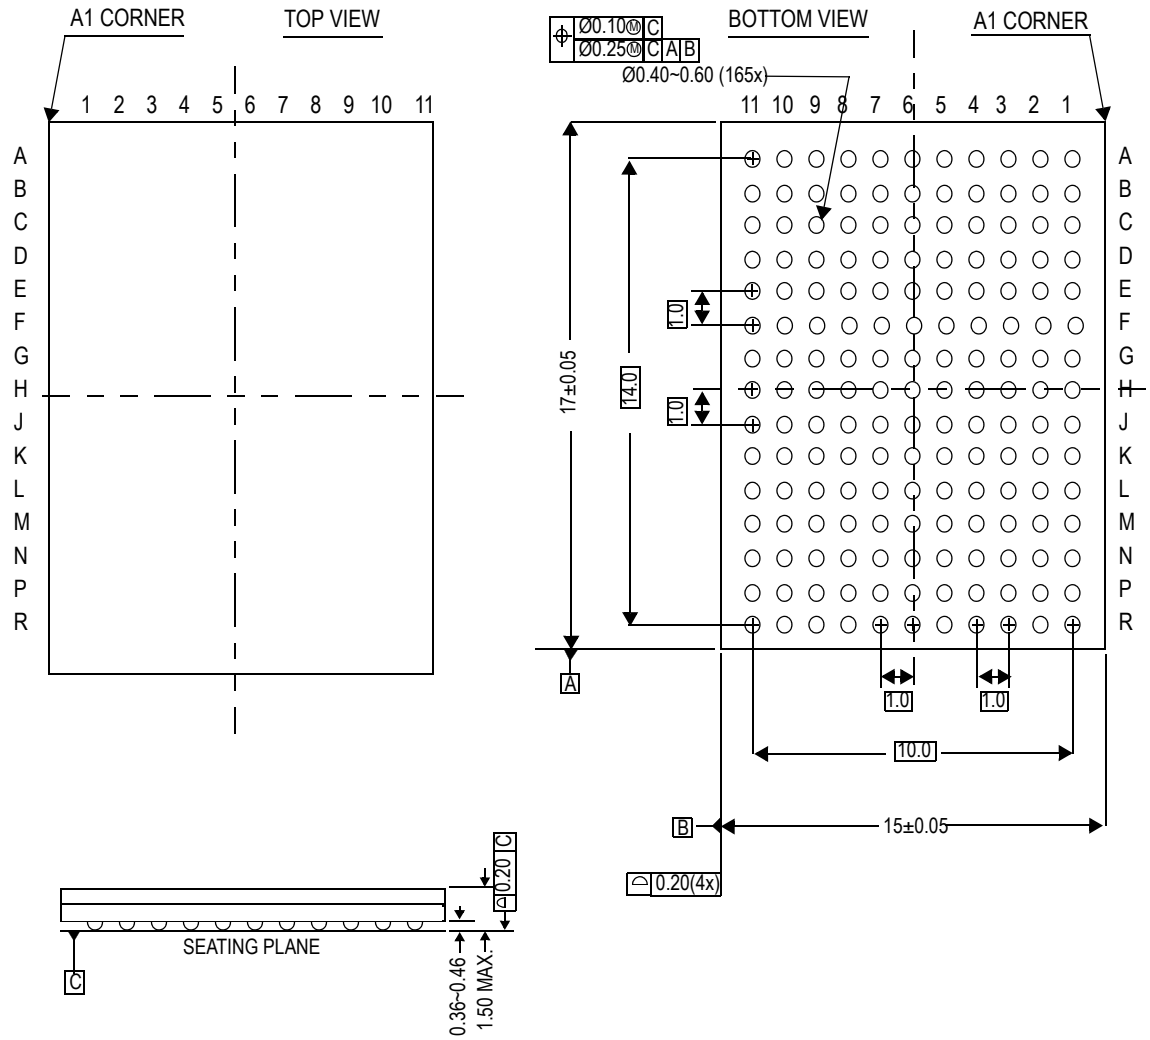
TDI & TMS Set Up Time	tTS	10	—	ns
TDI & TMS Hold Time	tTH	10	—	ns

Package Dimensions—165-Bump FPBGA (Package E)



Ordering Information—GSI SigmaCIO DDR-II SRAM

Org	Part Number1	Type	Package	Speed (MHz)	TA[2]
4M x 8	GS8342T08AE-333	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	333	C
4M x 8	GS8342T08AE-300	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	300	C
4M x 8	GS8342T08AE-250	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	250	C
4M x 8	GS8342T08AE-200	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	200	C
4M x 8	GS8342T08AE-167	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	167	C
4M x 8	GS8342T08AE-333I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	333	I
4M x 8	GS8342T08AE-300I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	300	I
4M x 8	GS8342T08AE-250I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	250	I
4M x 8	GS8342T08AE-200I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	200	I
4M x 8	GS8342T08AE-167I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	167	I
4M x 9	GS8342T09AE-333	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	333	C
4M x 9	GS8342T09AE-300	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	300	C
4M x 9	GS8342T09AE-250	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	250	C
4M x 9	GS8342T09AE-200	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	200	C
4M x 9	GS8342T09AE-167	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	167	C
4M x 9	GS8342T09AE-333I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	333	I
4M x 9	GS8342T09AE-300I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	300	I
4M x 9	GS8342T09AE-250I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	250	I
4M x 9	GS8342T09AE-200I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	200	I
4M x 9	GS8342T09AE-167I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	167	I
2M x 18	GS8342T18AE-333	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	333	C
2M x 18	GS8342T18AE-300	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	300	C
2M x 18	GS8342T18AE-250	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	250	C
2M x 18	GS8342T18AE-200	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	200	C
2M x 18	GS8342T18AE-167	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	167	C
2M x 18	GS8342T18AE-333I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	333	I
2M x 18	GS8342T18AE-300I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	300	I
2M x 18	GS8342T18AE-250I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	250	I
2M x 18	GS8342T18AE-200I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	200	I

Notes:

1. For Tape and Reel add the character “T” to the end of the part number. Example: GS834x36E-300T.
2. TA = C = Commercial Temperature Range. TA = I = Industrial Temperature Range.

Ordering Information—GSI SigmaCIO DDR-II SRAM

Org	Part Number1	Type	Package	Speed (MHz)	TA[2]
2M x 18	GS8342T18AE-167I	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	167	I
1M x 36	GS8342T36AE-333	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	333	C
1M x 36	GS8342T36AE-300	SigmaCIO DDR-II B2 SRAM	165-Pin BGA	300	C

Notes:

1. For Tape and Reel add the character “T” to the end of the part number. Example: GS834x36E-300T.
2. TA = C = Commercial Temperature Range. TA = I = Industrial Temperature Range.

Revision History

Rev. Code: Old; New	Types of Changes Format or Content	Revisions
GS8342TxxA_r1		• Creation of new datasheet
GS8342TxxA_r1; GS8342TxxA_r1_01	Content	• Updated MAX tKHKH • (Rev. 1.01a: Updated Note 4 in HSTL Output Driver DC Electrical Characteristics table)
GS8342TxxA_r1_01; GS8342TxxA_r1_02	Content	• Updated tKHK̄H, tKHCH in AC Char table • Added tK̄HKH and CQ Phase Distortion to AC Char table
GS8342TxxA_r1_02; GS8342TxxA_r1_03	Content	• Added Power-up sequence section • Added CZ operating current numbers
GS8342TxxA_r1_03; GS8342TxxA_r1_04	Content	• Changed status to PQ
GS8342TxxA_r1_043; GS8342TxxA_r1_05	Content	• Added V_{REF} note to Pin Description table • Updated FLXDrive-II Output Driver Impedance Control section • Removed Preliminary banner due to production status
