

### GENERAL DESCRIPTION

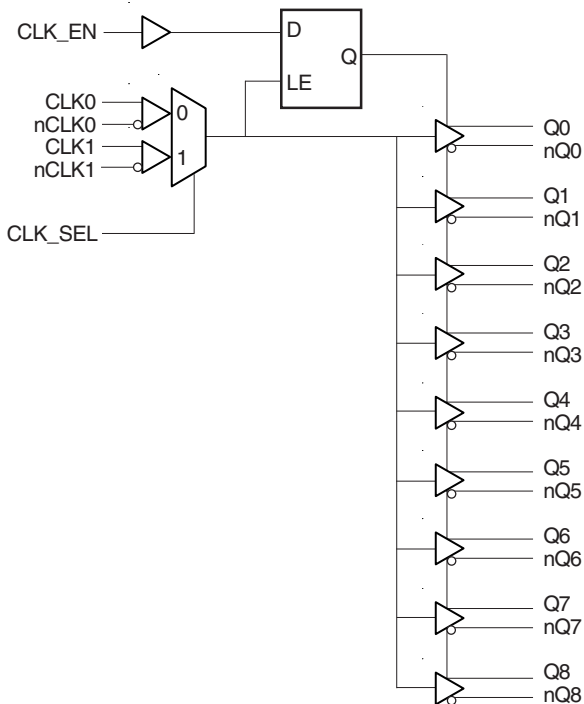

The ICS8521I-03 is a low skew, 1-to-9 Differential-to-LVHSTL Fanout Buffer. The ICS8521I-03 has two selectable clock inputs. Redundant clock pairs, CLK0, nCLK0 and CLK1, nCLK1 can accept most standard differential input levels. The clock enable is internally synchronized to eliminate runt pulses on the outputs during asynchronous assertion/deassertion of the clock enable pin.

Guaranteed output skew and part-to-part skew characteristics make the ICS8521I-03 ideal for today's most advanced applications, such as IA64 and static RAMs.

### FEATURES

- 9 LVHSTL outputs
- Redundant differential CLK0, nCLK0 and CLK1, nCLK1 inputs
- CLKx, nCLKx pairs can accept the following differential input levels: LVPECL, LVDS, LVHSTL, SSTL, HCSL
- Maximum output frequency: 500MHz
- Output skew: 50ps (maximum)
- Part-to-part skew: 250ps (maximum)
- Propagation delay: 1.6ns (maximum)
- $V_{OH} = 1V$  (maximum)
- 3.3V core, 1.8V output operating supply voltages
- -40°C to 85°C ambient operating temperature

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 2 shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{DD}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{DD} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

#### SCHEMATIC EXAMPLE

This application note provides general design guide using ICS8521I-03 LVHSTL buffer. Figure 3A shows a schematic example of the ICS8521I-03 LVHSTL Clock buffer. In this example,

the input is driven by an LVHSTL driver. CLK\_EN is set at logic low to select CLK0/nCLK0 input.

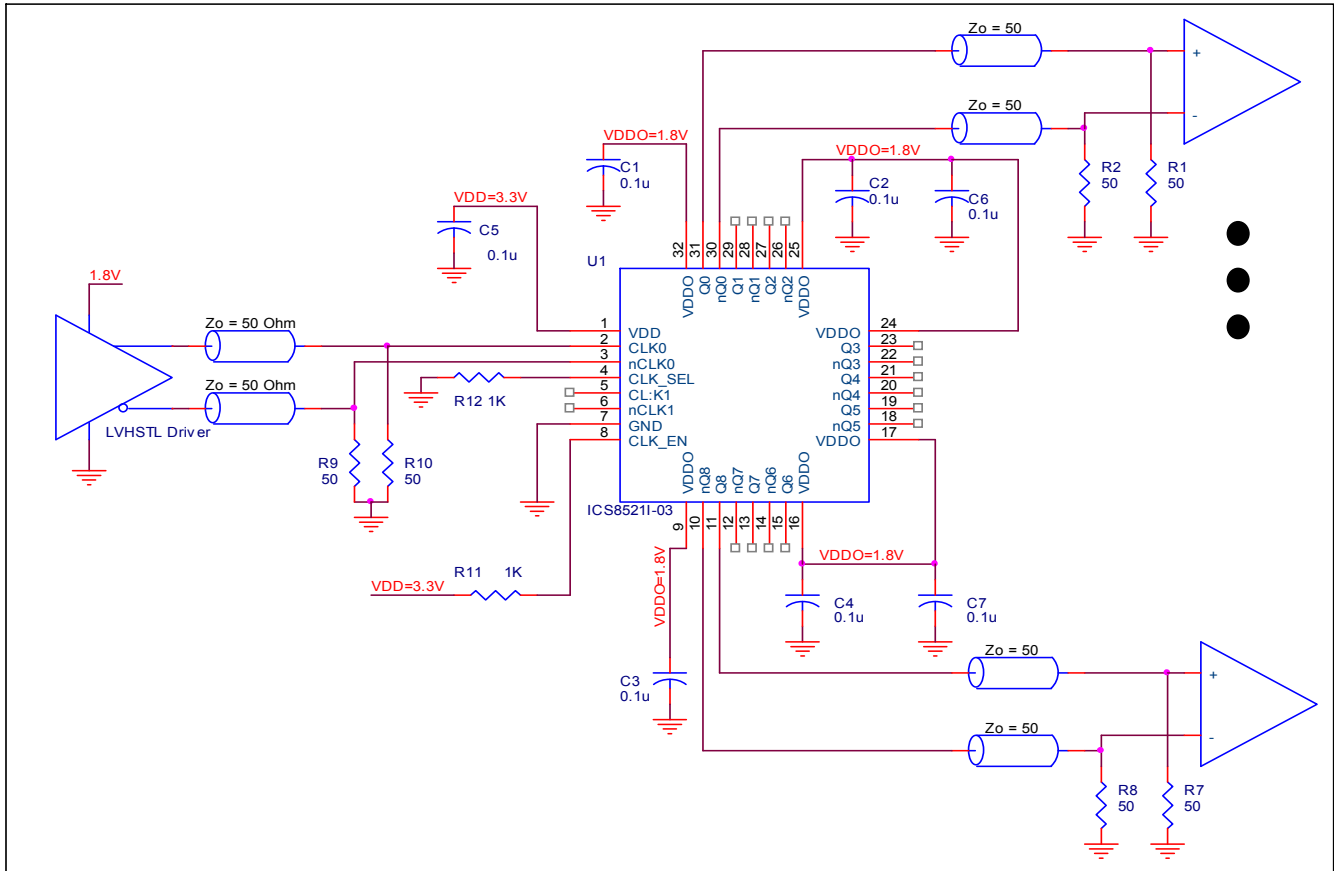

FIGURE 3A. ICS8521I-03 SCHEMATIC EXAMPLE

### POWER, GROUND AND BYPASS CAPACITOR

This section provides a layout guide related to power, ground and placement of bypass capacitors for a high-speed digital IC. This layout guide is a general recommendation. The actual board design will depend on the component types being used, the board density and cost constraints. This description assumes that the board has clean power and ground planes. The goal is to minimize the ESR between the clean power/ground plane and the IC power/ground pin. A low ESR bypass capacitor should be used on each power pin. The value of bypass capacitors ranges from 0.01uF to 0.1uF. The bypass capacitors should be located

as close to the power pin as possible. It is preferable to locate the bypass capacitor on the same side as the IC. *Figure 3B* shows suggested capacitor placement. Placing the bypass capacitor on the same side as the IC allows the capacitor to have direct contact with the IC power pin. This can avoid any vias between the bypass capacitor and the IC power pins. The vias should be placed at the Power/Ground pads. There should be a minimum of one via per pin. Increasing the number of vias from the Power/Ground pads to Power/Ground planes can improve the conductivity

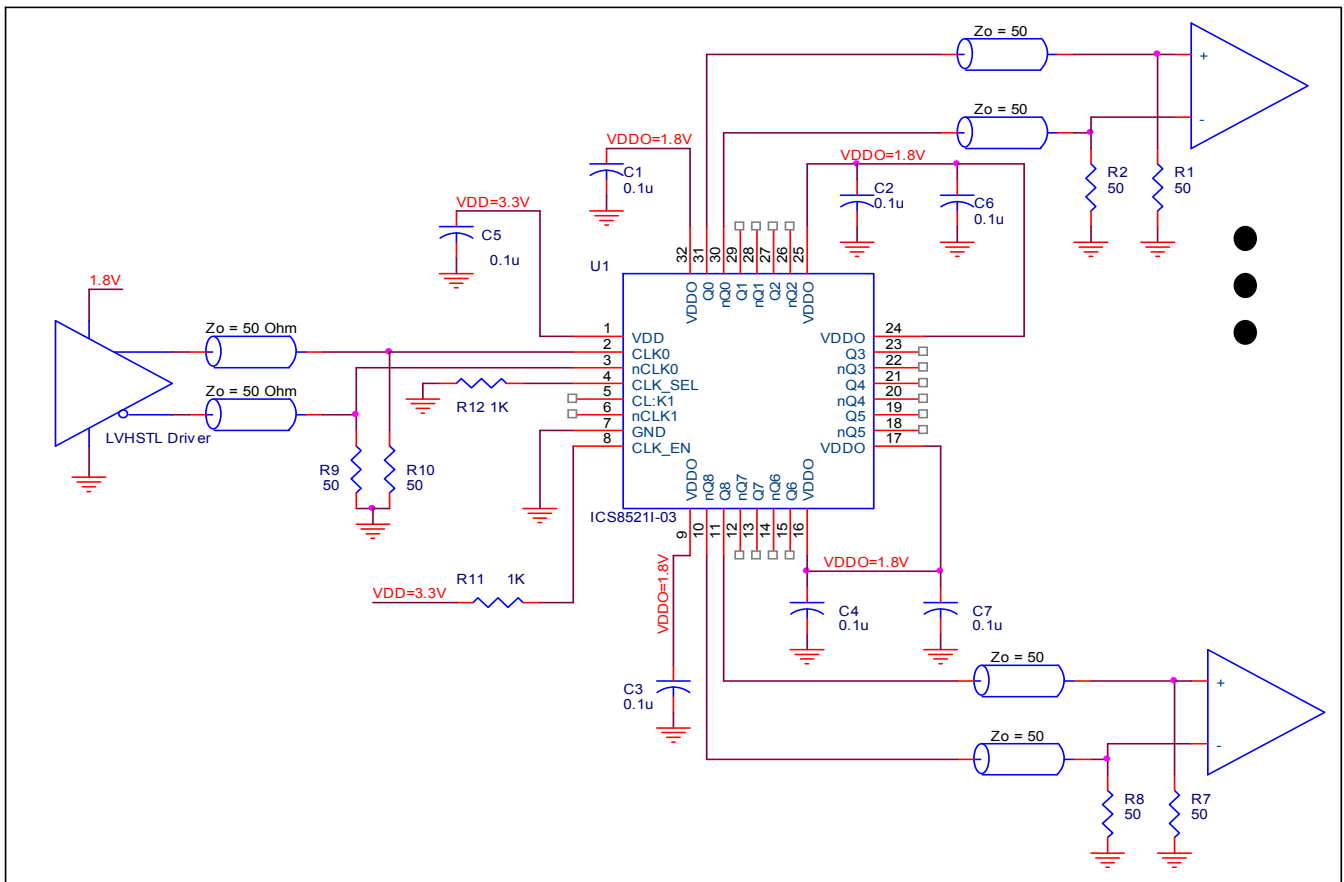

FIGURE 3B. RECOMMENDED LAYOUT OF BYPASS CAPACITOR PLACEMENT

#### DIFFERENTIAL CLOCK INPUT INTERFACE

The CLK/nCLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSTL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 4A to 4E show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here

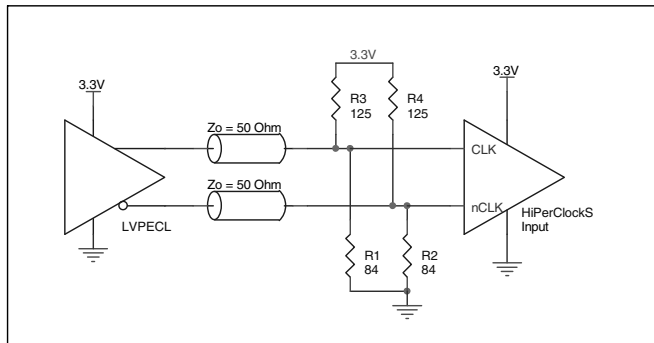

are examples only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in *Figure 4A*, the input termination applies for LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS8521I-03. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS8521I-03 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{DD} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{DD\_MAX} * I_{DD\_MAX} = 3.465V * 95mA = 329.2mW$
- Power (outputs)<sub>MAX</sub> = **32.8mW/Loaded Output pair**  
 If all outputs are loaded, the total power is  $9 * 32.8mW = 295.2mW$

**Total Power**<sub>MAX</sub> (3.465V, with all outputs switching) =  $329.2mW + 295.2mW = 624.4mW$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for the devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = junction-to-ambient thermal resistance

$Pd\_total$  = Total device power dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 42.1°C/W per Table 6 below. Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$85^\circ C + 0.624W * 42.1^\circ C/W = 111.3^\circ C$ . This is well below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 32-PIN LQFP, FORCED CONVECTION**

<b><math>\theta_{JA}</math> by Velocity (Linear Feet per Minute)</b>			
	<b>0</b>	<b>200</b>	<b>500</b>
Single-Layer PCB, JEDEC Standard Test Boards	67.8°C/W	55.9°C/W	50.1°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	47.9°C/W	42.1°C/W	39.4°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVHSTL output driver circuit and termination are shown in *Figure 5*.

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load.

Pd\_H is power dissipation when the output drives high.

Pd\_L is the power dissipation when the output drives low.

$$Pd_H = (V_{OH\_MAX} / R_L) * (V_{DDO\_MAX} - V_{OH\_MAX})$$

$$Pd_L = (V_{OL\_MAX} / R_L) * (V_{DDO\_MAX} - V_{OL\_MAX})$$

$$Pd_H = (1.0V/50\Omega) * (2V - 1.0V) = \mathbf{20mW}$$

$$Pd_L = (0.4V/50\Omega) * (2V - 0.4V) = \mathbf{12.8mW}$$

Total Power Dissipation per output pair = Pd\_H + Pd\_L = **32.8mW**
