

Data Sheet

Description

The HMMC-5200 is a DC to 20 GHz, 9.5 dB gain, feedback amplifier designed to be used as a cascadable gain block for a variety of applications. The device consists of a modified Darlington feedback pair which reduces the sensitivity to process variations and provides 50 ohm input/output port matches. Furthermore, this amplifier is fabricated using MWTC's Heterojunction Bipolar Transistor (HBT) process which provides excellent process uniformity, reliability and 1/f noise performance. The device requires a single positive supply voltage and generally operates Class–A for good distortion performance.

Chip Size:	410 * 460 μ m (16.1 x 18.1 mils)
Chip Size Tolerance:	$\pm 10 \mu$ m (± 0.4 mils)
Chip Thickness:	127 \pm 15 μ m (5.0 \pm 0.6 mils)
Pad Dimensions:	70 * 70 μ m (2.8 x 2.8 mils), or larger

Features

- High Bandwidth, F-1dB: 21 GHz Typical
- Moderate Gain: 9.5 dB \pm 1 dB @ 1.5 GHz
- P-1dB @ 1.5 GHz: 12.5 dBm Typical
- Low I/f Noise Corner: <20 kHz Typical
- Single Supply Operation >4.75 volts @ 44 mA Typ.
- Low Power Dissipation: 190 mW Typ. for chip

Symbol	Parameters/Conditions	Min.	Max.	Units
VCC	VDC Pad Voltage		8.0	Volts
VPAD	Output Pad Voltage		3.5	Volts
Pin	RF Input Power, Continuous		+6	dBm
TJ	Junction Temperature		+150	$^{\circ}$ C
Top	Operating Temperature	-55	+85	$^{\circ}$ C
Tst	Storage Temperature	-65	+165	$^{\circ}$ C
Tmax	Max. Assembly Temperature		+300	$^{\circ}$ C

Notes:

DC Specifications/Physical Properties

(Typicals are for VCC = + 5V, Rout = 64Ω)

Symbol	Parameters/Conditions	Min.	Typ.	Max.	Units
VCC	Supply Voltage	4.75	6.0		Volts
IC1	Stage–One Supply Current	14.5	17	20	mA
IC2	Stage–Two Supply Current	26	29	32	mA
IC1+IC2	Total Supply Current		46		mA
θJ-bs	Thermal Resistance[1]				
	(Junction–to–Backside at TJ = 150°C)	340		°	

Notes:

1. Backside ambient operating temperature TA = Top = 25°C unless otherwise noted.
2. Thermal resistance (in °C/Watt) at a junction temperature T(°C) can be estimated using the equation: $\theta(T) = \theta(T_J) [T(°C)+273] / [T_J(°C)+273]$ where $\theta(T_J=150°C) = \theta_{J-bs}$.

RF Specifications

(TA = 25°C, VCC = + 5V, Rout = 64Ω 50Ωsystem)

Symbol	Parameters/Conditions	Min.	Typ.	Max.	Units

	(@ 15 GHz)		7.5		
	(@ 16 GHz)		8		
	(@ 18 GHz)		8.5		

Applications

The HMMC-5200 can be used for a variety of applications requiring moderate amounts of gain and low power dissipation in a 50Ω system.

Biassing and Operation

The HMMC-5200 can be operated from a single positive supply. This supply must be connected to two points on the chip, namely the VCC pad and the output pad. The supply voltage may be directly connected to the VCC pad as long as the voltage is between +4.75 to +7 volts; however, if the supply is higher than +7 volts, a series resistor (RCC) should be used to reduce the voltage to the VCC pad. See the bonding diagram for the equation used to select RCC. In the case of the output pad, the supply voltage must be connected to the output transmission line through a resistor and an inductor. The required value of the resistor is given by the equation:

$$R_{out} = 35.7V_{supply} - 114.3\Omega,$$

where V_{supply} is in volts. If R_{OUT} is greater than 300Ω, the inductor may be omitted, however, the amplifier's gain may be reduced by ~0.5 dB. Figure 4 shows a recommended bonding strategy.

The chip contains a backside via to provide a low inductance ground path; therefore, the ground pads on the IC should not be bonded.

The voltage at the IN and OUT pads of the IC will be approximately 3.2 volts; therefore, DC blocking caps should be used at these ports.

Figure 1. Simplified Schematic Diagram

Assembly Techniques

It is recommended that the RF input and RF output connections be made using 0.7 mil diameter gold wire. The chip is designed to operate with 0.1–0.3 nH of inductance at the RF input and output. This can be accomplished by using 10 mil bond wire lengths on the RF input and output. The bias supply wire can be a 0.7 mil diameter gold wire attached to the VCC bonding pad.

GaAs MMICs are ESD sensitive. ESD preventive measures must be employed in all aspects of storage, handling, and assembly.

MMIC ESD precautions, handling considerations, die attach and bonding methods are critical factors in successful GaAs MMIC performance and reliability.

Agilent application note #54, "GaAs MMIC ESD, Die Attach and Bonding Guidelines" provides basic information on these subjects.

26.0	-	0.343	150.8	-	0.212	-	6.0	1.997	-	-	0.203	106.8

Notes:

If $4.75V \leq V_{supply} \leq 7V$
 $R_{CC} = 0$
 If $V_{supply} > 7V$
 $R_{CC} = [(V_{supply} - 6.5) * (1/0.01725)] \Omega$

$R_{out} =$
 $[(V_{supply} - 3.2) * (1/0.028)] \Omega$

Note: For optimum performance, the input and output bond wire inductances should each be 0.1f–0.3 nH. (bond wire has about 20 pH/mil of inductance).
 † Lchoke is optional if R_{out} is greater than 300Ω, however, gain will be reduced by about 0.5 dB.

Note: Blocking Cap required on Input and Output
